Abstract: In this paper, we found the location and asymptotic of the eigenvalues of the linear differential equation

\[-y'' + q(x)y = \lambda^2 p(x)y, x \in (0, a)\]

with the boundary conditions

\[y'(a) + i\lambda y(a) = y'(0) + i\lambda y(0) = 0\]

and the normalized condition

\[\int_0^a \rho(x)|y(x)|^2 dx = 1\]

where \(\lambda\) is a spectral parameter.

Keywords: boundary conditions, eigenvalues, eigenfunctions, asymptotic behaviors.

1 Introduction

Consider the linear differential equation

\[-y'' + q(x)y = \lambda^2 p(x)y, x \in (0, a)\]

where \(\lambda\) is a spectral parameter, \(q(x)\) and \(p(x)\) are real-valued continuous functions and positive on the interval \((0, a)\) with the boundary conditions contains the spectral parameter \(\lambda\) and normalized condition of the forms:

\[y'(a) + i\lambda y(a) = y'(0) + i\lambda y(0) = 0\]

\[\int_0^a \rho(x)|y(x)|^2 dx = 1\]

Numerous problems of oscillation theory for spatially distributed systems lead to necessity of study of eigenvalues and their appropriate eigenfunctions of differential operators as well as to issues related to study of various functional of eigenvalues and eigenfunctions. It is known that many problems of mathematical physics, mechanics, elasticity theory, optimal control leads to the problem of studying the spectrum of differential operators and the expansion of arbitrary functions in series of eigenfunctions of the operator. In [1-6], the eigenvalues and the corresponding eigenfunctions to the differential (1) studied, but they used different boundary conditions in which we used in this paper.

2 The main results

The aim of our article is to found the location and asymptotic for the eigenvalues to the problem (1)-(3) (named problem \(H_1\)) which appear in the following theorems in below:

**Theorem 1:** Let \(\lambda\) be an eigenvalue corresponding to the eigenfunction \(y(x)\) of the problem \(H_1\), if \(\delta \neq 0\) and \(\rho(x) > 0\) then \(\lambda\) is complex, and located in upper half plane.

**Proof:**

Multiply equation (1) by \(\bar{y}(x)\) and integrate the resulting
equation from 0 up to $a$, as a result we shall get:

$$
\int_0^a y''(x)\tilde{y}(x)dx + \int_0^a q(x)y(x)\tilde{y}(x)dx
= \int_0^a \lambda^2 p(x)y(x)\tilde{y}(x)dx,
= y'(\tilde{y}(a) + y'(0)\tilde{y}(0)) \int_0^a |y'(x)|^2 + \lambda^2 \int_0^a q(x)|y'(x)|^2dx
= \int_0^a \lambda^2 p(x)y(x)\tilde{y}(x)dx,
$$

In view of boundary conditions (2) we have:

$$
- i\lambda y'(a)\tilde{y}(a) - i\lambda y'(0)\tilde{y}(0) \int_0^a |y'(x)|^2 + \lambda^2 \int_0^a q(x)|y'(x)|^2dx
= \int_0^a \lambda^2 p(x)y(x)\tilde{y}(x)dx,
$$

Hence

$$
- i\lambda |y(a)|^2 - i\lambda |y(0)|^2 + \lambda^2 \int_0^a q(x)|y'(x)|^2dx
= \int_0^a \lambda^2 p(x)y(x)\tilde{y}(x)dx
$$

In equation (1) and in boundary condition (2) replace $y(x)$ by $\hat{y}(x)$ the following equations are obtained:

$$
-\hat{y}(0) = y'(a) + i\lambda \hat{y}(a) = 0.
$$

Multiplying differential equation on $y(x)$ and integrate from 0 to $a$, yields:

$$
i\lambda y'(a)\hat{y}(a) + i\lambda y'(0)\hat{y}(0) \int_0^a |y'(x)|^2 + \lambda^2 \int_0^a q(x)|y'(x)|^2dx
= \int_0^a \lambda^2 p(x)y(x)\hat{y}(x)dx
$$

Subtracting equations (4) from (5) we obtain:

$$
i(\lambda + \tilde{\lambda}) |y(a)|^2 + |y(0)|^2 = (\lambda^2 - (\tilde{\lambda}^2) \int_0^a p(x)|y(x)|^2dx,
= i(\lambda + \tilde{\lambda}) |y(a)|^2 + |y(0)|^2 = (\lambda - (\tilde{\lambda}) \int_0^a p(x)|y(x)|^2dx,
$$

Clearly, $(\lambda + \tilde{\lambda}) \neq 0$ because $\delta \neq 0$, then

$$
2i\sigma \int_0^a p(x)|y(x)|^2dx - i(y(a)^2 + |y(0)|^2) = 0,
$$

Thus, $\sigma = \frac{|y(a)|^2 + |y(0)|^2}{2 \int_0^a p(x)|y(x)|^2dx}$

Hence $\lambda$ is complex and located in upper half plane. Thus the theorem is proved.

**Theorem 2:**

Asymptotic behaviour of eigenvalues of the problem (1)-(2) in the case of regular and in the sector $T_1$ has the form:

$$
\lambda_m = \frac{1}{d}(m\pi - \frac{i}{2}lnC_0 + O(\frac{1}{m})),
$$

where $C_0 = \frac{-\sqrt{p(a)} + 1}{\sqrt{p(a)} - 1}(1 + \sqrt{\rho(p)})$

**Proof:**

Consider the determinant of $\Delta(\lambda)$, defined by

$$
\Delta(\lambda) = |U_k(y_j)|_{k,j=0,1}.
$$

$$
U_k(y_j) = \sum_r 1(-i\lambda w_k)^{r-2}y_j^{(r-1)}(a,\lambda) = 0,
$$

$$
, k = 0, j = 0, 1.
$$

$$
U_k(y_j) = \sum_r 1(-i\lambda w_k)^{r-2}y_j^{(r-1)}(0,\lambda) = 0,
$$

$$
, k = 1, j = 0, 1.
$$

$$
U_0(y_0) = (-i\lambda)\tilde{y}_0(a,\lambda) + \tilde{y}_0(a,\lambda) = 0.
$$

$$
U_0(\tilde{y}_0) = (-i\lambda)\tilde{y}_0(0,\lambda) + \tilde{y}_1(0,\lambda) = 0.
$$

$$
U_0(\tilde{y}_0) = i\lambda \tilde{y}_0(0,\lambda) + \tilde{y}_1(0,\lambda) = 0.
$$

$$
y_j^{(s)}(x,\lambda) = (\phi_k \lambda)^{e^{k\pi/2}} \int_0^a q(x)|y(x)|^2dx[A_0 + O(\frac{1}{\lambda})],
$$

$$
s = 0, 1.
$$

The following results can be obtained by using the formula (6) and the boundary conditions (2).

$$
U_0(\tilde{y}_0) = (iw_0\tilde{\lambda})[\frac{1}{\sqrt{p(0)}}][\sqrt{p(0)} - 1)
$$

$$
= \frac{1}{\sqrt{p(0)}}[\frac{1}{\sqrt{p(0)}}],
$$

where $w_j = e^{i\frac{(j-k)\pi}{n}}$.

$$
U_0(\tilde{y}_1) = -i\lambda e^{-i\tilde{\lambda}}(\sqrt{p(a)} + 1)[\frac{1}{\sqrt{p(0)}}]
$$

$$
= i\lambda (1 - \sqrt{p(0)})[\frac{1}{\sqrt{p(0)}}],
$$

$$
U_1(\tilde{y}_1) = i\lambda (1 + \sqrt{p(0)})[\frac{1}{\sqrt{p(0)}}],
$$

\[ \Delta(\lambda) = \begin{vmatrix}
\frac{1}{\sqrt{\rho(a)}} & -\frac{1}{\sqrt{\rho(0)}} \\
\frac{1}{\sqrt{\rho(0)}} & 0
\end{vmatrix} = 0 \]

and

\[ \Delta(\lambda) = \begin{vmatrix}
\frac{1}{\sqrt{\rho(a)}} & (i\lambda)^2e^{-i\lambda d}(1-\sqrt{\rho(0)}(\sqrt{\rho(a)+1})e^{-i\lambda d} \\
\frac{1}{\sqrt{\rho(0)}} & 0
\end{vmatrix} = 0. \]

Suppose \( f(\lambda) = (i\lambda)^2\begin{vmatrix}
\frac{1}{\sqrt{\rho(0)}} & \frac{1}{\sqrt{\rho(a)}} \\
\frac{1}{\sqrt{\rho(a)}} & 0
\end{vmatrix} \)

\[ \Delta(\lambda) = f(\lambda)[(1+\sqrt{\rho(0)}(\sqrt{\rho(a)-1})e^{i\lambda d} + (1-\sqrt{\rho(0)}(\sqrt{\rho(a)+1})e^{-i\lambda d} = 0 \]

\[ e^{2i\lambda d} = \frac{1}{2}(m\pi\pi - i\ln C_0 + O(1/m)) \]

\[ \lambda_m = \frac{1}{d}(m\pi\pi - i\ln C_0 + O(1/m)) \]

In the case of regular the sector \( T_1 \) asymptotic behaviour of spectrum has the form:

\[ \lambda_m = \frac{1}{d}(m\pi\pi - i\ln C_0 + O(1/m)) \]

(\( N \) is natural number), and in the sector \( T_2 \)

\[ \lambda_m = \frac{1}{d}(m\pi\pi + i\ln C_0 + O(1/m)) \]

(\( N \) is natural number). Thus the theorem is proved.

**Theorem 3:** Asymptotic behavior of eigenvalues of the problem (1)-(2) in the case of irregular and in the sector \( T_1 \) has the form:

\[ \lambda_m = \frac{1}{d}(-m\pi + \frac{i}{2}\ln C_0 + \frac{i}{2}\ln \rho^0 + O(1)) \]

and in the sector \( T_2 \) asymptotic behaviour of spectrum has the form:

\[ \lambda_m = \frac{1}{d}(-m\pi - \frac{i}{2}\ln C_0 - \frac{i}{2}\ln \rho^0 + O(1) \]

where

\[ C_0 = \frac{(4\pi)^2}{a} \int q(a) + \frac{1}{4}\rho^0(a) dx \]

and \( d = \int_0^a \sqrt{\rho(x)} dx \), such that

\[ q(a) + \frac{1}{4}\rho^0(a) \neq 0 \cdot q(0) + \frac{1}{4}\rho^0(0) \neq 0. \]

**Proof:**

Consider the determinant of \( \Delta(\lambda) \), which is defined by:

\[ \Delta(\lambda) = [U_k(y_j)(\{e_{j-1}, 1\})_{j=k, 0}^1, U_k(y_j)] = (-i\lambda w_k y_j(0, \lambda) + \bar{y}_j(0, \lambda) = 0, for k = 0, U_k(y_j) = (-i\lambda w_k y_j(0, \lambda) + \bar{y}_j(0, \lambda) = 0, for k = 1, U_0(y_0) = -i\lambda \bar{y}_0(0, \lambda) + \bar{y}_0(0, \lambda), U_0(y_1) = -i\lambda \bar{y}_1(0, \lambda) + \bar{y}_1(0, \lambda), U_1(y_0) = i\lambda \bar{y}_0(0, \lambda) + \bar{y}_0(0, \lambda), U_1(y_1) = i\lambda \bar{y}_1(0, \lambda) + \bar{y}_1(0, \lambda), U_0(y_0) = \epsilon^{2i\lambda d}(i\lambda)\bar{s}_1(A_{0(p)}(a) + s_3) + \frac{1}{\lambda 2i} A_{1(p)}(a) + s_4 + O(1/\lambda^2), \]

\[ U_0(y_1) = \epsilon^{2i\lambda d}(-i\lambda)\bar{s}_1(A_{0(p)}(a) + s_3) + \frac{1}{\lambda 2i} A_{0(p)}(a) + s_4 + O(1/\lambda^2), \]

\[ U_1(y_0) = i\lambda \bar{s}_2(A_{0(p)}(0) + s_3) - \frac{1}{\lambda 2i} A_{0(p)}(a) + s_4 + O(1/\lambda^2), \]

\[ U_1(y_1) = i\lambda \bar{s}_1(A_{0(p)}(0) + s_3) - \frac{1}{\lambda 2i} A_{1(p)}(a) + s_4 + O(1/\lambda^2). \]

where

\[ A_{0(p)}(a) = 1, \]

\[ A_{1(p)}(a) = \int_0^a (q(t)A_0 - A_{0}''A_0) dt, ..., \]

\[ A_{n(p)}(a) = \int_0^a (q(t)A_{n-1} - A_{n-1}''A_{n-1}) dt, ..., \]

\[ s_1 = (1 + \sqrt{\rho(a)}), \]

\[ s_2 = (1 + \sqrt{\rho(a)}), \]

\[ s_3 = \frac{1}{\lambda 2i} A_{1(p)}(a), \]

\[ s_4 = \frac{2}{\lambda^2} \frac{1}{(2i)^2} A_{1(p)}^2(a) \]

and

\[ s_5 = \frac{2}{\lambda^2} \frac{1}{(2i)^2} A_{1(p)}(0) \]

Spectrum of (1)-(2) coincides with the root of the equation: \( \Delta(\lambda) = 0 \), then

\[ \Delta(\lambda) = \begin{vmatrix}
\frac{1}{\sqrt{\rho(a)}} & \frac{1}{\sqrt{\rho(0)}} \\
\frac{1}{\sqrt{\rho(0)}} & 0
\end{vmatrix} = 0 \]

where

\[ a_{11} = \epsilon^{2i\lambda d}(-i\lambda)\bar{s}_1(A_{0(p)}(a) + \frac{1}{\lambda 2i} A_{1(p)}(a)) + 2\frac{1}{\lambda^2} A_{0(p)}(a) + s_4 + O(1/\lambda^2), \]

\[ a_{12} = \frac{1}{\sqrt{\rho(a)}} \int q(a) + \frac{1}{4}\rho^0(a) \]

\[ a_{21} = \frac{1}{\sqrt{\rho(0)}} \int q(0) + \frac{1}{4}\rho^0(0) \]

\[ a_{22} = 0. \]
\[ a_{12} = e^{i\lambda d}(-i\lambda)(s_1(A_{0(p)}(a) - s_3) - 2\frac{1}{\lambda}(-2i)A'_{0(p)}(a) - s_4 + O(\frac{1}{\lambda^2})), \]

\[ a_{21} = i\lambda (s_2(A_{0(p)}(0) + 1 + 2\frac{2}{\lambda}A'_{1(p)}(0)) + 2\frac{2}{\lambda}A'_{0(p)}(0) + s_5 + O(\frac{1}{\lambda^2})), \]

\[ a_{22} = i\lambda (s_2(A_{0(p)}(0) + 1 + 2\frac{2}{\lambda}A'_{1(p)}(0)) - 2\frac{1}{\lambda}(-2i)A'_{0(p)}(0) - s_5 + O(\frac{1}{\lambda^2})), \]

\[ \Rightarrow - (i\lambda)^2 e^{i\lambda d}(s_1(A_{0(p)}(a) + s_3) + 2\frac{2}{\lambda}A'_{0(p)}(a) + s_4 + O(\frac{1}{\lambda^2}))s_2(A_{0(p)}(0) + 2\frac{1}{\lambda}(-2i)A'_{0(p)}(0) - s_5 + O(\frac{1}{\lambda^2})) \]

\[ = -(4\lambda^2 + \frac{\lambda}{2}A_{1(p)}(a) - A'_{1(p)}(a))(4\lambda^2 + A'_{1(p)}(0)) \]

\[ = (q(a) + \frac{1}{4}\rho''(a))(q(0) + \frac{1}{4}\rho''(0))[1] \]

\[ = 0, \]

From which we obtain that:

\[ e^{2\lambda d} \]

\[ = \frac{-16\lambda^4}{(q(a) + \frac{1}{4}\rho''(a))(q(0) + \frac{1}{4}\rho''(0))[1]} \]

\[ = 0, \]

\[ \Rightarrow e^{2\lambda d}[1] = C_0 \lambda^4 \]

where

\[ C_0 = \frac{(4i)^2}{(q(a) + \frac{1}{4}\rho''(a))(q(0) + \frac{1}{4}\rho''(0))[1]} = 0, \]

and \( q(a) + \frac{1}{4}\rho''(a) \neq 0, q(0) + \frac{1}{4}\rho''(0) \neq 0. \)

Taking the initial approximation \( \lambda_0 = \frac{m\pi}{d} \), and using the method of successive approximation we obtain:

\[ \lambda_{m} = \frac{1}{d}(m\pi - \frac{i}{2}\ln c_0 - \frac{i}{2}n\pi^4 + o(1) \quad \text{where} \quad m = N,N+1,... \quad (N \text{ is natural number}), \text{ and in the sector} \]

\[ T_2 \quad \lambda_{m} = \frac{1}{d}(m\pi + \frac{i}{2}\ln c_0 + \frac{i}{2}n\pi^4 + o(1) \quad \text{where} \quad m = N,N+1,... \quad (N \text{ is natural number}). \text{ Thus the theorem is proved.} \]
