Abstract: We state and prove a general summation identity. The identity is then applied to derive various summation formulas involving the generalized harmonic numbers and related quantities. Interesting results, mostly new, are obtained for both finite and infinite sums. The high points of this paper are the discovery of several previously unknown infinite summation results involving non-linear generalized harmonic number terms and the derivation of interesting alternating summation formulas involving these numbers.

Keywords: harmonic numbers, Riemann zeta function, polygamma function, polylogarithm function, Bernoulli number, Euler number, summation identity

1 Introduction

Harmonic numbers have been studied since ancient times. Numerous interesting results, especially infinite summation involving these special numbers are scattered in the literature. References \cite{1,2,3,4,5} and further references therein are good sources of information on the subject. In this paper, the generalized harmonic number of order \( m \) is denoted by \( H_{N,m} \), defined as usual by

\[
H_{N,m} = \sum_{r=1}^{N} \frac{1}{r^m},
\]

where \( H_{N,1} = H_N \) is the \( N \)-th harmonic number. The generalized harmonic number converges to the Riemann Zeta function, \( \zeta(m) \):

\[
\lim_{N \to \infty} H_{N,m} = \zeta(m), \quad \Re[m] > 1,
\]

since

\[
\zeta(m) = \sum_{r=1}^{\infty} \frac{1}{r^m}.
\]

We define the generalized associated harmonic number by

\[
h_{N,m} = \sum_{r=1}^{N} \frac{1}{(2r-1)^m},
\]

with \( h_{N,1} \equiv h_N \) and note that

\[
\lim_{N \to \infty} h_{N,m} = (1 - 2^{-m}) \zeta(m), \quad \Re[m] > 1.
\]

To establish the connection between \( H_{N,m} \) and \( h_{N,m} \) we first make the following elementary observation:

\[
\sum_{s=1}^{r} f_s = \sum_{s=1}^{(r-a_r)/2} f_{2s} + \sum_{s=1}^{(r+a_r)/2} f_{2s-1}, \quad (1.1)
\]

where we have introduced the symbol \( a_r = r \mod 2 \).

Taking \( f_s = 1/s^m \) in the identity \((1.1)\) allows us to write

\[
H_{r,m} = \frac{1}{2m} H(r-a_r)/2,m + \sum_{s=1}^{(r+a_r)/2} \frac{1}{(2s-1)^m},
\]

which gives, on evaluation at \( r = 2N \) and at \( r = 2N - 1 \), respectively,

\[
\sum_{s=1}^{N} \frac{1}{(2s-1)^m} = H_{2N,m} - \frac{1}{2m} H_{N,m} = h_{N,m} \quad (1.2)
\]

and

\[
\sum_{s=1}^{N} \frac{1}{(2s-1)^m} = H_{2N-1,m} - \frac{1}{2m} H_{N-1,m} = h_{N,m}. \quad (1.3)
\]

In what follows, various summation formulas involving $H(r,m)$ and $h(r,m)$ will be derived. Most of these formulas are new and many known results are particular cases of those obtained here. In particular we will derive the following presumably previously unknown summation identities, whose summands contain terms quadratic in $H(r,2)$, $H(r,3)$ and $h(r,2)$:

$$
\sum_{r=1}^{\infty} \frac{h_r^2}{r^2} = \frac{19}{720} \pi^4 + \frac{1}{2} \zeta(3)^2, \\
\sum_{r=1}^{\infty} \frac{h_r^2}{(r+1)^2} = \frac{19}{720} \pi^4 - \zeta(3)^2, \\
\sum_{r=1}^{\infty} \frac{h_r^2}{(r+1)^2} = \frac{1}{2} \zeta(3)^2 + \frac{1}{6} \zeta(5) + \pi^2 \zeta(3) + \pi^2 \zeta(5)
$$

and

$$
\sum_{r=1}^{\infty} \frac{h_r^2}{4r^2 - 1} = \frac{3\pi^2}{64} \zeta(3).
$$

We will also deduce the following remarkable formulas:

$$
2 \sum_{r=1}^{\infty} (-1)^{r-1} H_{2n} = \left( 1 - \frac{1}{2^{2n}} \right) \zeta(2n), \quad n \neq 1,
$$

$$
2 \sum_{r=1}^{\infty} (-1)^{r-1} h_{2n} = \beta(2n), \\
2 \sum_{r=1}^{\infty} (-1)^{r-1} h_{2n+1} = \frac{|E_{2n-1}|}{2^{2n} \Gamma(2n-1)} \pi^{2n-1},
$$

$$
2 \sum_{r=1}^{\infty} (-1)^{r-1} H_{2n-1} = \left( \frac{2^{2n-1} - 1}{2(2n-1)} \right) \beta(m), \\
2 \sum_{r=1}^{\infty} (-1)^{r-1} h_{2n-1} = \beta(2n),
$$

where $B_m$ is the $m$th Bernoulli number, $E_m$ is the $m$th Euler number and

$$
\beta(m) = \sum_{s=1}^{\infty} \frac{(-1)^{s-1}}{(2s-1)^m}.
$$

Special cases of the above alternating sums include:

$$
2 \sum_{r=1}^{\infty} (-1)^{r-1} H_2 = \frac{\pi^2}{12}, \\
2 \sum_{r=1}^{\infty} (-1)^{r-1} h_r = \frac{\pi}{4}, \\
2 \sum_{r=1}^{\infty} (-1)^{r-1} h_r = G,
$$

$$
2 \sum_{r=1}^{\infty} (-1)^{r-1} H_2 = \frac{\pi^2}{12} - \log^2 2, \\
2 \sum_{r=1}^{\infty} (-1)^{r-1} h_r = -G,
$$

$$
2 \sum_{r=1}^{\infty} (-1)^{r-1} h_r = \frac{\pi^2}{4},
$$

where $G = \beta(2)$ is Catalan’s constant.

In section 3 numerous finite summation formulas will be derived.

2 Summation Formula

**Theorem 1.** Given a non-singular summand, $f_{rs}$, $r,s \in \mathbb{Z}^+$, $1 \leq r,s \leq N$, $N \in \mathbb{Z}^+$, the following summation identity holds:

$$
\sum_{r=1}^{N} \sum_{s=1}^{r} (f_{rs} + f_{sr}) = \sum_{r=1}^{N} f_{rr} + \sum_{r=1}^{N} f_{sr}.
$$

The proof is by mathematical induction on $N$. The theorem is obviously true for $N = 1$. Assume that the proposition is true for $N = K \in \mathbb{Z}^+$, so that

$$
P_K : \sum_{r=1}^{K} \sum_{s=1}^{r} (f_{rs} + f_{sr}) = \sum_{r=1}^{K} f_{rr} + \sum_{r=1}^{K} f_{sr}.
$$

We now show that $P_{K+1}$ is valid whenever $P_K$ holds.

$$
P_{K+1} : \sum_{r=1}^{K+1} \sum_{s=1}^{r} (f_{rs} + f_{sr}) = \sum_{r=1}^{K+1} f_{rr} + \sum_{r=1}^{K+1} f_{sr}.
$$

**Proof.**

$$
\sum_{r=1}^{K} \sum_{s=1}^{r} (f_{rs} + f_{sr}) + f_{K+1,r} + \sum_{s=1}^{K+1} f_{sr} = \sum_{r=1}^{K+1} f_{rr} + \sum_{r=1}^{K+1} f_{sr}.
$$

We now invoke $P_K$.

$$
\sum_{r=1}^{K} \sum_{s=1}^{r} (f_{rs} + f_{sr}) + f_{K+1,r} + \sum_{s=1}^{K+1} f_{sr} = \sum_{r=1}^{K+1} f_{rr} + \sum_{r=1}^{K+1} f_{sr}.
$$

1. If the summand $f_{rs}$ is symmetric in the summation indices $r$ and $s$, that is, if $f_{rs} = f_{sr}$, then

$$
2 \sum_{r=1}^{N} \sum_{s=1}^{r} f_{rs} = \sum_{r=1}^{N} f_{rr} + \sum_{r=1}^{N} f_{sr}.
$$

2. If $f_{rs}$ is factorable, that is if $f_{rs} = g_r g_s$, then

$$
\sum_{r=1}^{N} \left( g_r \sum_{s=1}^{r} g_s \right) + \sum_{r=1}^{N} \left( g_s \sum_{s=1}^{r} g_r \right) = \sum_{r=1}^{N} g_r h_r + \left( \sum_{r=1}^{N} g_r \right)^2.
$$

In particular, if $f_{rs} = g_r g_s$, then

$$
\sum_{r=1}^{N} \left( g_r \sum_{s=1}^{r} g_s \right) = \sum_{r=1}^{N} (g_r)^2 + \left( \sum_{r=1}^{N} g_r \right)^2.
$$

3. Setting $f_{rs} = g_s$ in identity (2.1) gives

$$
\sum_{r=1}^{N} \sum_{s=1}^{r} g_s = (N + 1) \sum_{r=1}^{N} g_r - \sum_{r=1}^{N} r g_r.
$$
3 Applications

3.1 General finite summation formulas involving the generalized harmonic numbers

Example 1.

Choosing \( g_s = 1/s^a \) in identity (2.5) gives

\[
\sum_{r=1}^{N} H_{r,n} = (N+1)H_{N,n} - H_{N,n-1}, \tag{3.1}
\]

while setting \( g_s = H_{s,n} \) in identity (2.5) and using identity (3.1) gives

\[
2 \sum_{r=1}^{N} rH_{r,n} = N(N+1)H_{N,n} + H_{N,n-1} - H_{N,n-2}. \tag{3.2}
\]

In particular

\[
\sum_{r=1}^{N} H_r = (N+1)H_N - N \tag{3.3}
\]

and

\[
\sum_{r=1}^{N} rH_r = 2N(N+1)H_N - \frac{1}{4}N(N-1) \tag{3.4}
\]

Taking \( g_s = sH_{s,n} \) in identity (2.5) and using identities (3.1) and (3.2), we find

\[
\sum_{r=1}^{N} r^2H_{r,n} = \frac{N(N+1)(2N+1)}{6}H_{N,n} - \frac{1}{6}H_{N,n-1} + \frac{1}{2}H_{N,n-2} - \frac{1}{3}H_{N,n-3}. \tag{3.5}
\]

In particular

\[
\sum_{r=1}^{N} r^2H_r = \frac{N(N+1)(2N+1)}{6}H_N - \frac{N(N-1)(4N+1)}{36}. \tag{3.6}
\]

If we set \( g_s = H_{s,n}/s^a \) in equation (2.5) and make use of equation (3.25), we obtain the identity

\[
\sum_{r=1}^{N} H_{r,n}^2 = (N+1)H_{N,n}^2 + H_{N,2n-1}^2 - 2 \sum_{r=1}^{N} \frac{H_{r,n}}{r+1}. \tag{3.7}
\]

Upon setting \( n = 1 \) in equation (3.7) we obtain the interesting result

\[
\sum_{r=1}^{N} H_r^2 = (N+1)H_N^2 - (2N+1)H_N + 2N. \tag{3.8}
\]

Identity (3.1) appeared in [6] (Equation (43)) and is listed in Wikipedia [3]. The particular cases, identities (3.3) and (3.4) are also derived in [7], (equation 2.36, page 41 and equation 2.57, page 56).

Using identity (1.1) we write

\[
\sum_{r=1}^{N} H_{r,n} = \sum_{r=1}^{N} H_{2r,n} + \sum_{r=1}^{N} H_{2r,n} - \frac{1}{2n}H_{(N+a_N)/2,n} \tag{3.9}
\]

from which upon using identity (3.1), we get

\[
2 \sum_{r=1}^{N} H_{2r,n} = 2(N+1)H_{2N,n} - H_{2N,n-1} - H_{N,n}. \tag{3.9}
\]

Example 2.

The choice of \( f_s = (2r-1)^{-m}s^{-n} \) in the identity (2.3) leads to

\[
\sum_{r=1}^{N} H_{r,n} = \sum_{r=1}^{N} H_{2r,n} + \sum_{r=1}^{N} H_{2r,n} - \frac{1}{2n}H_{(N+a_N)/2,n} \tag{3.10}
\]

On setting \( n = 0 \) in identity (3.10) we obtain

\[
\sum_{r=1}^{N} h_{r,m} = \left( N + \frac{1}{2} \right) h_{N,m} - \frac{1}{2}h_{N,m-1}. \tag{3.11}
\]

In particular,

\[
\sum_{r=1}^{N} h_r = \left( N + \frac{1}{2} \right) h_N - \frac{N}{2}. \tag{3.12}
\]

Using the identities (1.1) and (3.48) gives

\[
2 \sum_{r=1}^{N} h_{2r,n} = 2 \sum_{r=1}^{N} h_{2r,n} + 2 \sum_{r=1}^{N} h_{2r,n} - h_{N+a_N,n} + h_{N+a_N,n} \tag{3.13}
\]

which, together with identity (3.11) then gives

\[
4 \sum_{r=1}^{N} h_{2r,n} = 2(2N+1)h_{2N,n} - h_{2N,n-1} - h_{2N,n} \tag{3.13}
\]

Substituting \( g_s = h_{s,m} \) in identity (2.5) and using identity (3.11) gives

\[
\sum_{r=1}^{N} h_{r,m} = \left( \frac{N(N+1)}{2} + \frac{1}{8} \right) h_{N,m} - \frac{1}{8}h_{N,m-2}. \tag{3.14}
\]

In particular

\[
\sum_{r=1}^{N} h_r = \left( \frac{N(N+1)}{2} + \frac{1}{8} \right) h_N - \frac{N^2}{8}. \tag{3.15}
\]
Taking \(g_s = h_{s,a}(2s - 1)^{-n}\) in identity (2.5) and using the result (3.31) we find

\[
2\sum_{r=1}^{N} h_{r,n}^2 = (2N + 1)h_{N,n}^2 + h_{N,2n-1} - 2\sum_{r=1}^{N} \frac{h_{r,n}}{(2r - 1)^{n-1}}.
\]  

(3.16)

Now setting \(n = 1\) in equation (3.16) we obtain

\[
2\sum_{r=1}^{N} h_{r}^2 = (2N + 1)h_{N}^2 - 2Nh_{N} + N.
\]  

(3.17)

Example 3.

The choice \(f_{rs} = H_rH_s\) in identity (2.3) gives

\[
2\sum_{r=1}^{N} \left\{ H_r \sum_{r=1}^{N} h_{s} \right\} = \sum_{r=1}^{N} h_{r}^2 + \left( \sum_{r=1}^{N} H_r \right)^2.
\]

(3.18)

The use of identities (3.3), (3.4) and (3.8) in identity (3.18) leads to

\[
\sum_{r=1}^{N} rH_{r}^2 = \frac{N(N+1)}{2}H_{N}^2 - \frac{(N^2 - N - 1)}{2}H_{N} + \frac{N(N-3)}{4}.
\]

Similarly, the choice \(f_{rs} = h_rh_s\) in identity (2.3) gives

\[
2\sum_{r=1}^{N} \left\{ h_r \sum_{r=1}^{N} h_{s} \right\} = \sum_{r=1}^{N} h_{r}^2 + \left( \sum_{r=1}^{N} h_r \right)^2.
\]

(3.19)

The use of identities (3.12), (3.15) and (3.17) in identity (3.19) leads to

\[
\sum_{r=1}^{N} rh_{r}^2 = \frac{(2N + 1)^2}{8}h_{N}^2 - \frac{(2N + 1)(2N - 1)}{16}h_{N} + \frac{N^2}{16}.
\]

Example 4.

Let

\[
f_{rs} = \frac{x^{pr}y^{qs}}{(r+a)^m(r+b)^n},
\]

\(f_{rs}\) is factorable, so we apply equation (2.3), which gives immediately

\[
\sum_{r=1}^{N} \left\{ \frac{x^{pr}}{(r+a)^m} \sum_{s=1}^{N} \frac{y^{qs}}{(s+b)^n} \right\} + \sum_{r=1}^{N} \left\{ \frac{y^{pr}}{(r+b)^n} \sum_{s=1}^{N} \frac{x^{ps}}{(s+a)^m} \right\} = \sum_{r=1}^{N} \frac{(x^{pr}y^{qs})^r}{(r+a)^m(r+b)^n} + \left( \sum_{r=1}^{N} \frac{x^{pr}}{(r+a)^m} \right) \left( \sum_{r=1}^{N} \frac{y^{pr}}{(r+b)^n} \right)
\]

(3.20)

Various combinations of the parameters \(p, q, m, n, a, b\) and the variables \(x, y\) may be considered. As an example if we choose \(p = 0 = q\), then we have the interesting result

\[
\sum_{r=1}^{N} \frac{H_{r+b,n}}{(r+a)^m} + \sum_{r=1}^{N} \frac{H_{r+a,m}}{(r+b)^n} = H_{N+a,m}H_{N+b,n} - H_{a,m}H_{b,n} + \sum_{r=1}^{N} \frac{1}{(r+a)^{m}(r+b)^n}.
\]

(3.21)

In deriving the identity (3.21) we made use of the identity

\[
\sum_{r=1}^{N} \frac{1}{(r+q)^p} = H_{x+q,p} - H_{q,p}.
\]

Interesting special cases of identity (3.21) include

\[
\sum_{r=1}^{N} \frac{H_{r,n}}{r^m} + \sum_{r=1}^{N} \frac{H_{r,m}}{r^n} = H_{N,m+n} + H_{N,m}H_{N,n},
\]

(3.22)

\[
\sum_{r=1}^{N} \frac{H_{r,n}}{(r+1)^m} + \sum_{r=1}^{N} \frac{H_{r,m}}{(r+1)^n} = H_{N+1,n}H_{N+1,m} - H_{N,n+m} - \frac{1}{(N+1)^n(N+1)^m}
\]

(3.23)

and

\[
\sum_{r=1}^{N} \frac{H_{r,n}}{(r+1)^m} + \sum_{r=1}^{N} \frac{H_{r,m}}{r^n} = H_{N+1,m}H_{N,n}.
\]

(3.24)

The particular case \(m = n\) in equations (3.22) and (3.23) gives

\[
2\sum_{r=1}^{N} \frac{H_{r,n}}{r^m} = H_{N,2n} + H_{N,n}^2
\]

(3.25)

and

\[
2\sum_{r=1}^{N} \frac{H_{r,n}}{(r+1)^n} = H_{N,2n}^2 - H_{N,2n} + \frac{2H_{N,n}}{(N+1)^n}.
\]

(3.26)

The particular case corresponding to \(n = 1\) in (3.26) is also found in [6] (page 850, Theorem 16, example).

Equation (3.62) of reference [1] corresponds to setting \(n = 1\) in identity (3.25).

Example 5.
Substitution of \( f_{rs} = (2r + 2a - 1)^{-m}(2s + 2b - 1)^{-n} \) into equation (2.3) gives

\[
\sum_{r=1}^{N} \frac{h_{r,b,n}}{(2r+2a-1)^m} + \sum_{r=1}^{N} \frac{h_{r,a,m}}{(2r+2b-1)^n} = h_{N+a,m}h_{N+b,n} - h_{a,m}h_{b,n} + \sum_{r=1}^{N} \frac{1}{(2r+2a-1)^m(2r+2b-1)^n}.
\]

Note that in deriving the identity (3.27) we made use of the identity

\[
\sum_{t=1}^{N} \frac{1}{(2r+2a-1)^m} = h_{N+a,1}h_{N+b,1} - h_{a,1}h_{b,1}.
\]

Interesting special cases of identity (3.27) include

\[
\sum_{r=1}^{N} \frac{h_{r,n}}{(2r-1)^m} + \sum_{r=1}^{N} \frac{h_{r,m}}{(2r-1)^n} = h_{N+1,a}h_{N+1,m} - h_{N+1,1}h_{N+1,1},
\]

(3.28)

\[
\sum_{r=1}^{N} \frac{h_{r,n}}{(2r+1)^m} + \sum_{r=1}^{N} \frac{h_{r,m}}{(2r+1)^n} = h_{N+1,a}h_{N+1,m} - h_{N+1,1}h_{N+1,1}.
\]

(3.29)

Example 6.

Substitution of \( f_{rs} = r^{-n}z^{3r} \) into identity (2.3) gives, after some rearrangement,

\[
\sum_{r=1}^{N} z^r H_{r,n} = \frac{1}{1-z} \sum_{r=1}^{N} \frac{z^r}{r^m} - \frac{z^{N+1}}{1-z} h_{N,n}, \quad z \neq 1,
\]

(3.35)

while substitution of \( f_{rs} = (2r - 1)^{-n}z^{2r-1} \) into identity (2.3) yields

\[
\sum_{r=1}^{N} z^{2r-1} H_{r,n} = \frac{1}{1-z^2} \sum_{r=1}^{N} \frac{z^{2r-1}}{(2r-1)^n} - \frac{z^{2N+1}}{1-z^2} h_{N,n}, \quad z \neq 1.
\]

(3.36)

Example 7.

If we choose \( f_{rs} = H_{r,n}/r^m s^m \) in the equation (2.3) we obtain the following identity, valid for all complex numbers \( n, m \) and positive integers \( N \):

\[
2 \sum_{r=1}^{N} \frac{H_{r,n} H_{r,m}}{r^m} + \sum_{r=1}^{N} \frac{H_{r,2n}}{r^m} + \sum_{r=1}^{N} \frac{H_{r,n}^2}{r^m} = 2 \sum_{r=1}^{N} \frac{H_{r,n}}{r^{m+n}} + H_{N,m} H_{N,2n} + H_{N,n} H_{N,n}.
\]

(3.37)

In particular, setting \( m = n \) and using also the identity (3.25) we obtain the beautiful result

\[
3 \sum_{r=1}^{N} \frac{H_{r,n}^2}{r^m} - 3 \sum_{r=1}^{N} \frac{H_{r,n}}{r^m} = H_{N,n}^3 - H_{N,3n},
\]

(3.38)

or equivalently,

\[
3 \sum_{r=1}^{N} \frac{H_{r,n}^2}{r^m} + 3 \sum_{r=1}^{N} \frac{H_{r,2n}}{r^m} = H_{N,n}^3 + 3H_{N,2n} H_{N,n} + 2H_{N,3n}.
\]

(3.39)

Note that since

\[
H_{r,n} = H_{r+1,n} - \frac{1}{(r+1)^n},
\]

identity (3.38) can also be written

\[
3 \sum_{r=1}^{N} \frac{H_{r,n}^2}{(r+1)^m} + 3 \sum_{r=1}^{N} \frac{H_{r,n}}{(r+1)^{2n}} = H_{N+1,n}^3 + 2H_{N+1,3n} + \frac{2}{(N+1)^{3n}} - \frac{3H_{N+1,n}^3}{(N+1)^{2n}}.
\]

(3.40)
Addition of identities (3.38) and (3.40) gives

\[
3 \sum_{r=1}^{N} \frac{H_{r,n}^2}{(r+1)^n} + 3 \sum_{r=1}^{N} \frac{H_{r,n}^2}{r^n} = H_{N+1,n}^3 + H_{N,n} + H_{N,3n} + \frac{2}{(N+1)^3} - \frac{3H_{N+1,n}}{(N+1)^2n}
\]

(3.41)

Example 8.

The choice \( f_{rs} = h_{r,n}(2r-1)^{-n}(2s-1)^{-m} \) in equation (2.3) yields the following identity, which holds for all complex numbers \( n, m \) and positive integers \( N \):

\[
2 \sum_{r=1}^{N} \frac{h_{r,n}h_{r,m}}{(2r-1)^n} + \sum_{r=1}^{N} \frac{h_{r,2n}}{(2r-1)^m} = 2 \sum_{r=1}^{N} \frac{h_{r,n}}{(2r-1)^{m+n}} + h_{N,n}h_{N,2n} + h_{N,m}h_{N,m}^2.
\]

(3.42)

In particular, setting \( m = n \) and using also the identity (3.31) we obtain the interesting result

\[
3 \sum_{r=1}^{N} \frac{h_{r,n}^2}{(2r-1)^n} - 3 \sum_{r=1}^{N} \frac{h_{r,n}}{(2r-1)^{2n}} = \frac{2}{(N+1)^3} - \frac{3H_{N,n}}{(N+1)^2n}, \quad (3.43)
\]

or equivalently,

\[
3 \sum_{r=1}^{N} \frac{h_{r,n}^2}{(2r-1)^n} + 3 \sum_{r=1}^{N} \frac{h_{r,2n}}{(2r-1)^{n}} = \frac{2}{(N+1)^3} + \frac{3h_{N,n}h_{N,2n}}{2} + 3h_{N,3n} - 2h_{N,n}.
\]

(3.44)

Example 9.

In this example we derive a couple of alternating summation formulas.

First we introduce the notations

\[
\tilde{H}_{p,q} = \sum_{s=1}^{p} \frac{(-1)^{s-1}}{s^q} \quad \text{and} \quad \tilde{h}_{p,q} = \sum_{s=1}^{p} \frac{(-1)^{s-1}}{(2s-1)^q}.
\]

(3.45)

Then, from the identity (1.1) we have

\[
\tilde{H}_{N,n} = -\frac{1}{2n} \tilde{H}_{(N-a_N)/2,n} + \tilde{H}_{(N+a_N)/2,n},
\]

from which it follows that

\[
\tilde{H}_{2N,n} = -\frac{1}{2n} \tilde{H}_{N,n} + \tilde{H}_{N,n},
\]

(3.46)

and

\[
\tilde{H}_{2N,n} = -\frac{1}{2n} \tilde{H}_{N-1,n} + \tilde{H}_{N,n}.
\]

(3.47)

Similarly, using the identity (1.1) and the definitions of \( \bar{h} \) and \( \bar{H} \), it is straightforward to establish that

\[
2 \sum_{r=1}^{N} \frac{1}{(4r-1)^n} = \bar{h}_{2N,n} - \tilde{h}_{2N,n},
\]

(3.48)

and

\[
2 \sum_{r=1}^{N} \frac{1}{(4r-3)^n} = \bar{h}_{2N,n} + \tilde{h}_{2N,n},
\]

(3.49)

where \( \psi(n) \) is the \( n \)th polygamma function defined by

\[
\psi(n) = \frac{d^n \log \Gamma(x)}{dx^n}
\]

is the digamma function and \( \Gamma(x) \) is the gamma function. Using \( f_{rs} = (-1)^{r-1}r^{-n} \) in identity (2.3) we obtain

\[
\sum_{r=1}^{N} (-1)^{r-1}H_{r,n} = -\frac{1}{2n} H_{N-a_N}/2, + a_N H_{N,n},
\]

(3.50)

from which we get the interesting results

\[
\sum_{r=1}^{2N} (-1)^{r-1}H_{r,n} = -\frac{1}{2n} H_{N,n},
\]

(3.51)

and

\[
\sum_{r=1}^{2N-1} (-1)^{r-1}H_{r,n} = H_{N,n}.
\]

(3.52)

Similarly, using \( f_{rs} = (-1)^{r-1}(2r-1)^{-n} \) in identity (2.3) gives

\[
\sum_{r=1}^{N} (-1)^{r-1}h_{r,n} = -\sum_{r=1}^{(N-a_N)/2} \frac{1}{(4r-1)^n} + a_N H_{N,n},
\]

which leads to

\[
2 \sum_{r=1}^{2N} (-1)^{r-1}h_{r,n} = \tilde{h}_{2N,n} - \bar{h}_{2N,n},
\]

(3.53)

and

\[
2 \sum_{r=1}^{2N-1} (-1)^{r-1}h_{r,n} = \tilde{h}_{2N,n} + \bar{h}_{2N,n}.
\]

(3.54)
The particular case corresponding to \( n = 1 \) in identity (3.51) is also derived in [6] (Equation (39)).

Using \( f_{rs} = (-1)^{r-1}(-1)^{s-1}r^{-n} \) in identity (2.3) yields

\[
\sum_{r=1}^{2N} (-1)^{r-1} \frac{H_{r,n}}{r^m} = H_{N,n}/2^n \quad (3.55)
\]

and

\[
\sum_{r=1}^{2N-1} (-1)^{r-1} \frac{H_{r,n}}{r^m} = h_{N,n} \quad (3.56)
\]

Taking \( f_{rs} = (-1)^{(r-1)s}H_{r,n}r^{-m} \) in identity (2.3) gives

\[
\frac{1}{2^{m+n}} \sum_{r=1}^{N-\alpha_N}/2 \frac{H_{r,n}}{r^m} + \frac{H_{N,n}}{2} \sum_{r=1}^{(N-\alpha_N)/2} \frac{H_{r,n}}{(2r-1)^m} \\
+ \frac{N}{2} \sum_{r=1}^{N} (-1)^{r-1}H_{r,n}H_{r,m} \\
= \sum_{r=1}^{N} (-1)^{r-1} \left( \frac{H_{r,n}}{r^m} + \frac{H_{r,m}}{r^n} \right) \\
+ H_{N,m} \sum_{r=1}^{N} (-1)^{r-1}H_{r,n} \\
+ H_{N,n} \sum_{r=1}^{N} (-1)^{r-1}H_{r,m} \quad (3.57)
\]

Interchanging \( m \) and \( n \) in identity (3.57), adding the resulting identity to identity (3.57) and using identities (3.22) and (3.28) we obtain

\[
\sum_{r=1}^{2N-1} (-1)^{r-1} \left( 2H_{r,n}H_{r,m} + H_{r,n} - H_{r,m} \right) \\
= \frac{1}{2^{m+n}} \left( H_{N,m+n} + H_{N,m}H_{N,n} \right) \\
- h_{N,m+n} - h_{N,m}h_{N,n} \\
+ H_{2N-1,m}h_{N,n} + H_{2N-1,n}h_{N,m} \quad (3.58)
\]

and

\[
\sum_{r=1}^{2N} (-1)^{r-1} \left( 2H_{r,n}H_{r,m} - H_{r,n} - H_{r,m} \right) \\
= \frac{1}{2^{m+n}} \left( H_{N,-1,m+n} + H_{N,-1,m}H_{N,-1,n} \right) \\
- h_{N,m+n} - h_{N,m}h_{N,n} \\
+ H_{2N-1,m}h_{N,n} + H_{2N-1,n}h_{N,m} \quad (3.59)
\]

In particular

\[
\sum_{r=1}^{2N} (-1)^{r-1}H_{r,n} = 2h_{N,n-1} - h_{N,n} - 2NH_{2N-1,n} - H_{2N,n-1} \quad (3.60)
\]

\[
\sum_{r=1}^{2N-1} (-1)^{r-1}rH_{r,n} \\
= 2h_{N,n-1} - h_{N,n} + 2NH_{2N-1,n} - H_{2N-1,n-1} \quad (3.61)
\]

\[
\sum_{r=1}^{2N} (-1)^{r-1} \left( 2H_{r,n}^2 - 2H_{r,n} \right) = H_{N,2n} - H_{N,2n} - H_{2N,n} \quad (3.62)
\]

\[
\sum_{r=1}^{2N} (-1)^{r-1} \left( 2H_{r,n}^2 - 2H_{r,n} \right) = H_{N,2n} - H_{N,2n} - H_{2N,n} \quad (3.63)
\]

\[
\sum_{r=1}^{2N-1} (-1)^{r-1} \left( 2H_{r,n}^2 - 2H_{r,n} \right) = H_{N,2n} - H_{N,2n} - H_{2N,n} \quad (3.64)
\]

Corresponding to identities (3.63) and (3.64) we have, upon taking \( f_{rs} = (-1)^{(r-1)s}h_{r,n}(2r-1)^{-n} \) in identity (2.3)

\[
\sum_{r=1}^{2N} (-1)^{r-1} \left( h_{r,n} - \frac{h_{r,n}}{(2r-1)^n} \right) = -h_{2N,2n} - \bar{h}_{2N,2n} \quad (3.65)
\]

and

\[
\sum_{r=1}^{2N-1} (-1)^{r-1} \left( h_{r,n} - \frac{h_{r,n}}{(2r-1)^n} \right) = h_{2N-1,n} - \bar{h}_{2N-1,2n} \quad (3.66)
\]

### 3.2 Evaluation of infinite sums

In the limit \( N \to \infty \) in the above summation results and sometimes in combination with known results, it is possible to evaluate certain infinite sums. We now present some examples.
Example 10.

In the limit \( N \to \infty \), equations (3.38), (3.39) and (3.70) become

\[
3 \sum_{r=1}^{\infty} \frac{H_{r,n}^2}{r^n} - 3 \sum_{r=1}^{\infty} \frac{H_{r,n}}{r^{2n}} = \zeta(n)^3 - \zeta(3n), \quad n \neq 1, \quad (3.67)
\]

and

\[
3 \sum_{r=1}^{\infty} \frac{H_{r,n}^2}{r^n} + 3 \sum_{r=1}^{\infty} \frac{H_{r,2n}}{r^n} = \zeta(n)^3 + 3\zeta(n)\zeta(2n) + 2\zeta(3n), \quad n \neq 1.
\]

Evaluating identity (3.67) at \( n = 2 \) we obtain

\[
\sum_{r=1}^{\infty} \frac{H_{r,2}^2}{r^2} = \frac{19}{22680} \pi^6 + \zeta(3)^2, \quad (3.70)
\]

after using the known result:

\[
\sum_{r=1}^{\infty} \frac{H_{r,2}}{r^2} = \zeta(3)^2 - \frac{\pi^6}{2835}, \quad ([8], (B.9a), [2]).
\]

Now using the result (3.70) in identity (3.69), we also have

\[
\sum_{r=1}^{\infty} \frac{H_{r,2}^2}{(r+1)^2} = \frac{59}{22680} \pi^6 - \zeta(3)^2, \quad (3.71)
\]

Since

\[
H_{r,2-1,n} = \left( \frac{H_{r,n} - \frac{1}{r^n}}{r} \right)^2 = H_{r,n}^2 - \frac{2H_{r,n}}{r^n} + \frac{1}{r^{2n}},
\]

we have

\[
\sum_{r=1}^{\infty} \frac{H_{r,2}^2}{r(r+1)^2} = 2 \sum_{r=1}^{\infty} \frac{H_{r,2}}{r^2} - \zeta(5),
\]

and

\[
\sum_{r=1}^{\infty} \frac{H_{r,3}^2}{r(r+1)^2} = 2 \sum_{r=1}^{\infty} \frac{H_{r,3}}{r^3} - \zeta(7),
\]

from which upon using the known results

\[
2 \sum_{r=1}^{\infty} \frac{H_{r,2}}{r^3} = \pi^2 \zeta(3) - 9\zeta(5), \quad \text{(Eq. 3.3b of [9])},
\]

and

\[
\sum_{r=1}^{\infty} \frac{H_{r,4}}{r^2} = \pi^4 \zeta(3) - \frac{5\pi^2}{3} \zeta(5) - 17\zeta(7), \quad \text{(Eq. 3.5d of [9])},
\]

we obtain

\[
\sum_{r=1}^{\infty} \frac{H_{r,2}^2}{r(r+1)} = \pi^2 \zeta(3) - 10\zeta(5)
\]

and

\[
\sum_{r=1}^{\infty} \frac{H_{r,3}^2}{r(r+1)} = 35\zeta(7) - \frac{10\pi^2}{3} \zeta(5).
\]

Example 11.

In the limit \( N \to \infty \), equations (3.43) and (3.44) become

\[
3 \sum_{r=1}^{\infty} \frac{h_{r,n}^2}{(2r-1)^n} - 3 \sum_{r=1}^{\infty} \frac{h_{r,n}}{(2r-1)^{2n}} = (1 - 2^{-n})^3 \zeta(n)^3 - (1 - 2^{-3n})\zeta(3n),
\]

and

\[
3 \sum_{r=1}^{\infty} \frac{h_{r,2}^2}{(2r-1)^2} + 3 \sum_{r=1}^{\infty} \frac{h_{r,2}}{(2r-1)^2} = (1 - 2^{-n})^3 \zeta(n)^3 + 3(1 - 2^{-2n})(1 - 2^{-3n})\zeta(n)\zeta(2n) + 2(1 - 2^{-3n})\zeta(3n).
\]

Example 12.

Dividing through identity (3.25) by \( r^m \), summing and taking limit as \( N \to \infty \) gives

\[
2 \sum_{r=1}^{\infty} \left\{ \frac{1}{r^m} \sum_{s=1}^{r} \frac{H_{s,n}}{s^n} \right\} = \sum_{r=1}^{\infty} \frac{H_{r,2n}}{r^m} + \sum_{r=1}^{\infty} \frac{H_{r,2}}{r^m}, \quad m \neq 1.
\]

In particular \((m,n) = (2,1)\) and \((m,n) = (2,2)\) in (3.74) give, respectively,

\[
2 \sum_{r=1}^{\infty} \left\{ \frac{1}{r^2} \sum_{s=1}^{r} \frac{H_{s,1}}{s} \right\} = \sum_{r=1}^{\infty} \frac{H_{r,2}}{r^2} + \sum_{r=1}^{\infty} \frac{H_{r,2}}{r^2}, \quad (3.75)
\]

and

\[
2 \sum_{r=1}^{\infty} \left\{ \frac{1}{r^2} \sum_{s=1}^{r} \frac{H_{s,2}}{s^2} \right\} = \sum_{r=1}^{\infty} \frac{H_{r,4}}{r^2} + \sum_{r=1}^{\infty} \frac{H_{r,2}}{r^2}. \quad (3.76)
\]

Using equation (3.84) evaluated at \( n = 2 \) and the known result

\[
\sum_{r=1}^{\infty} \frac{H_{r,2}}{r^2} = \frac{17}{360} \pi^4, \quad ([4], [1]),
\]

in equation (3.75) we obtain

\[
\sum_{r=1}^{\infty} \left\{ \frac{1}{r^2} \sum_{s=1}^{r} \frac{H_{s,1}}{s} \right\} = \frac{\pi^4}{30}. \quad (3.77)
\]
Using the result (3.70) above and the known result
\[ \sum_{r=1}^{\infty} \frac{H_r^4}{r^2} = \frac{37}{11340} \pi^6 - \zeta(3)^2, \quad \text{(Formula (42) of [2])}, \]
in equation (3.76) we obtain
\[ \sum_{r=1}^{\infty} \left\{ \frac{1}{r} \sum_{s=1}^{r} \frac{H_r}{r^2} \right\} = \frac{31}{15120} \pi^6. \quad \text{(3.78)} \]
Equation (3.77) was also derived in reference [1].

Example 13.
In the limit \( N \to \infty \) in equation (3.35) of Example 6, we get the known result (Formula (36) of [2])
\[ \sum_{r=1}^{\infty} \epsilon' H_r = \frac{1}{1 - z} Li_n(z), \quad |z| < 1, \quad \text{(3.79)} \]
where \( Li_n \) is the polylogarithm function.

At \( n = 1 \) we have
\[ \sum_{r=1}^{\infty} \epsilon' H_r = -\frac{\log(1-z)}{1-z}, \quad |z| < 1. \]
Other interesting particular cases are
\[ \sum_{r=1}^{\infty} \frac{H_r^2}{2r} = \frac{\pi^2}{6} - \log^2 2 \]
and
\[ \sum_{r=1}^{\infty} \frac{H_r^3}{2r} = \frac{7}{4} \zeta(3) - \frac{1}{6} \pi^2 \log^2 2 + \frac{1}{3} \log^3 2. \]

Using the recurrence relation of the polygamma function
\[ \psi_m(z+1) = \psi_m(z) + \frac{(1)^m}{z+m+1}, \quad \text{(3.80)} \]
and the identity
\[ \psi_m(z) = \frac{(-1)^m}{z+m} \zeta(m+1) - H_{z+1,m+1}, \quad \text{(3.81)} \]
equation (3.79) can be written in terms of the polygamma function as
\[ \sum_{r=1}^{\infty} \epsilon' \psi_{n-1}(r) = (1)^{n-1}(n-1)! \frac{z}{1-z} [Li_n(z) - \zeta(n)], \quad n > 1, \quad |z| < 1. \]
In the limit \( N \to \infty \), identity (3.36) becomes
\[ 2 \sum_{r=1}^{\infty} z^{2r-1} h_{r,n} = \frac{Li_n(z) - Li_n(-z)}{1-z^2}, \quad |z| < 1. \]
In particular,
\[ 2 \sum_{r=1}^{\infty} z^{2r-1} h_r = \frac{1}{1-z^2} \log \left( \frac{1+z}{1-z} \right), \quad |z| < 1. \]

Example 14.
In the limit of \( N \to \infty \), equation (3.20) becomes
\[ \sum_{r=1}^{\infty} \left\{ \frac{x^p}{r^m} \sum_{s=1}^{r} \frac{y^q}{s^n} \right\} + \sum_{r=1}^{\infty} \left\{ \frac{y^q}{r^m} \sum_{s=1}^{r} \frac{x^p}{s^n} \right\} = Li_m(x^p y^q) + Li_m(y^p) Li_n(x^q), \quad \text{(3.82)} \]
where \( Li \) is a polylogarithm function.

Setting \( p = 0 = q \) in equation (3.82) or taking limit as \( N \to \infty \) directly in equation (3.22) we have
\[ \sum_{r=1}^{\infty} \frac{H_r}{r^m} + \sum_{r=1}^{\infty} \frac{H_r}{r^n} = \zeta(m+n) + \zeta(m) \zeta(n), \quad n,m \neq 1, \quad \text{(3.83)} \]
The use of equations (3.80) and (3.81) allows equation (3.83) to be written in terms of the polygamma function as
\[ \frac{(-1)^n}{(n-1)!} \sum_{r=1}^{\infty} \frac{\psi_{n-1}(r)}{r^m} + \frac{(-1)^m}{(m-1)!} \sum_{r=1}^{\infty} \frac{\psi_{m-1}(r)}{r^n} = \zeta(m+n) + \zeta(m) \zeta(n), \quad n,m \neq 1. \]
The particular case \( m = n \) in equation (3.83) gives
\[ 2 \sum_{r=1}^{\infty} \frac{H_r}{r^m} = \zeta(2n) + \zeta(n)^2, \quad n \neq 1. \quad \text{(3.84)} \]
The result equation (4.20) of reference [10] corresponds to an evaluation of the identity (3.84) at \( n = 2 \).

Equation (3.84) is listed as Formula (43) in [2].

Example 15.
In the limit \( N \to \infty \), identities (3.28) and (3.31) of Example 5 become
\[ \sum_{r=1}^{\infty} \frac{h_{r,n}}{(2r-1)^m} + \sum_{r=1}^{\infty} \frac{h_{r,m}}{(2r-1)^n} = (1 - 2^{-m-n}) \zeta(m+n) + (1 - 2^{-m})(1 - 2^{-n}) \zeta(m) \zeta(n), \quad n,m \neq 1, \quad \text{(3.85)} \]
and
\[
2 \sum_{r=1}^{\infty} \frac{h_{r,n}}{(2r-1)^n} = (1 - 2^{-2n}) \zeta(2n) + (1 - 2^{-n})^2 \zeta(n)^2, \quad n \neq 1,
\]
(3.86)

while identities (3.29) and (3.30) become
\[
\sum_{r=1}^{\infty} \frac{h_{r,n}}{(2r+1)^m} + \sum_{r=1}^{\infty} \frac{h_{r,m}}{(2r-1)^n} = \zeta(m) \zeta(n)(1 - 2^{-m})(1 - 2^{-n})
\]
(3.87)
and
\[
\sum_{r=1}^{\infty} \frac{h_{r,n}}{(2r+1)^m} + \sum_{r=1}^{\infty} \frac{h_{r,n}}{(2r-1)^n} = \zeta(n)^2(1 - 2^{-n})^2.
\]
(3.90)

Example 16.

The result equation (3.8c) of reference [9] implies that
\[
\sum_{r=1}^{\infty} \frac{h_{r,3}}{(2r-1)^2} = \frac{\pi^2}{16} \zeta(3) + \frac{31}{64} \zeta(5),
\]
(3.91)

from which, upon using identity (3.85), we get
\[
\sum_{r=1}^{\infty} \frac{h_{r,2}}{(2r-1)^3} = \frac{3\pi^2}{64} \zeta(3) + \frac{31}{64} \zeta(5).
\]
(3.92)

From identities (3.91) and (3.92) and using identity (3.88) we get
\[
\sum_{r=1}^{\infty} \frac{h_{r,3}}{(2r+1)^2} = \frac{\pi^2}{16} \zeta(3) - \frac{31}{64} \zeta(5)
\]
and
\[
\sum_{r=1}^{\infty} \frac{h_{r,2}}{(2r+1)^3} = \frac{3\pi^2}{64} \zeta(3) - \frac{31}{64} \zeta(5).
\]

Similarly from identities (3.51) and (3.52) we obtain
\[
2 \sum_{r=1}^{\infty} (-1)^{r-1} H_r = \log 2
\]
(3.97)
and
\[
2 \sum_{r=1}^{\infty} (-1)^{r-1} H_{r,n} = \left(1 - \frac{1}{2^{2n-1}}\right) \zeta(n), \quad n \neq 1.
\]
(3.98)

Example 17.

Letting \(N \to \infty\) in identity (3.10) of Example 2 we obtain
\[
\sum_{r=1}^{\infty} \frac{h_{r,m}}{r^2} + \sum_{r=1}^{\infty} \frac{h_{r-1,n}}{(2r-1)^m} = (1 - 2^{-m}) \zeta(m) \zeta(n), \quad n \neq 1, m \neq 1.
\]
(3.94)

In particular,
\[
\sum_{r=1}^{\infty} \frac{h_{r,n}}{r^n} + \sum_{r=1}^{\infty} \frac{H_{r-1,n}}{(2r-1)^m} = (1 - 2^{-n}) \zeta(n)^2, \quad n \neq 1.
\]
(3.95)

Example 18.

From the definition of \(\bar{H}\) and the identities (3.46) and (3.47) it follows that
\[
\lim_{N \to \infty} \bar{H}_{N,n} = \begin{cases} 
\log 2, & n = 1 \\
\left(1 - \frac{1}{2^{2n-1}}\right) \zeta(n), & n \neq 1.
\end{cases}
\]
(3.96)

Hence, from the identities (3.51) and (3.52) we obtain
\[
2 \sum_{r=1}^{\infty} (-1)^{r-1} H_r = \log 2
\]
(3.97)
and
\[
2 \sum_{r=1}^{\infty} (-1)^{r-1} H_{r,n} = \left(1 - \frac{1}{2^{2n-1}}\right) \zeta(n), \quad n \neq 1.
\]
(3.98)

Similarly from identities (3.53) and (3.54) and using identities (3.48) and (3.49) we have
\[
2 \sum_{r=1}^{\infty} (-1)^{r-1} h_{r,n} = \frac{1}{4^n} \Gamma(n) \left\{ \psi_{n-1} \left(\frac{1}{4}\right) - \psi_{n-1} \left(\frac{3}{4}\right) \right\}.
\]
(3.99)
In reference [11] it was established that
\[ \psi_{2n} \left( \frac{1}{4} \right) - \psi_{2n} \left( \frac{3}{4} \right) = -\pi (2\pi)^{2n} |E_{2n}| \]
and
\[ \psi_{2n-1} \left( \frac{1}{4} \right) - \psi_{2n-1} \left( \frac{3}{4} \right) = (2n - 1) 2^{4n} \beta(2n), \]
where
\[ \beta(m) = \lim_{N \to \infty} \bar{h}_{N,N} \sum_{s=1}^N \left( -1 \right)^{s-1} \]
and $E_m$ is the $m$th Euler number defined by the exponential generating function
\[ \frac{2}{e^t + e^{-t}} = \sum_{m=0}^\infty \frac{E_m t^m}{m!}. \]
Using these results in identity (3.99) we obtain
\[ 2 \sum_{r=1}^\infty (-1)^{r-1} h_{r,2n} = \beta(2n) \]
and
\[ 2 \sum_{r=1}^\infty (-1)^{r-1} h_{r,2n-1} = \frac{|E_{2n-2}|}{2^{2n} \Gamma(2n-1)} \pi^{2n-1}. \]
In particular
\[ 2 \sum_{r=1}^\infty (-1)^{r-1} h_r = \frac{\pi}{4}, \]
\[ 2 \sum_{r=1}^\infty (-1)^{r-1} h_{r,2} = G \]
and
\[ 2 \sum_{r=1}^\infty (-1)^{r-1} h_{r,3} = \frac{\pi^3}{32}. \]
From identities (3.59) and (3.60) we have
\[ \sum_{r=1}^\infty (-1)^{r-1} \left( 2H_{r,n} H_{r,m} - \frac{H_{r,n}}{r^n} - \frac{H_{r,m}}{r^m} \right) = \left( 1 - \frac{1}{2^{m+n-1}} \right) \zeta(m+n). \]
Setting $m = n$ in identity (3.105) yields
\[ 2 \sum_{r=1}^\infty (-1)^{r-1} \left( H_{r,n}^2 - \frac{H_{r,n}}{r^n} \right) = 2 \sum_{r=1}^\infty (-1)^{r-1} H_{r,n} H_{r-1,n} = - \left( 1 - \frac{1}{2^{2n-1}} \right) \zeta(2n). \]
Thus
\[ 2 \sum_{r=1}^\infty (-1)^{r-1} H_{r,n} H_{r-1,n} = - \frac{(2n-1)!}{(2n)!} |B_{2n}| \pi^{2n}, \]
where $B_m$ is the $m$th Bernoulli number defined by
\[ \frac{t}{e^t - 1} = \sum_{m=0}^\infty B_m t^m m! . \]
In particular
\[ 2 \sum_{r=1}^\infty (-1)^{r-1} H_r H_{r-1} = 2 \sum_{r=1}^\infty (-1)^{r-1} H_r^2 = 2 \sum_{r=1}^\infty (-1)^{r-1} \frac{H_r}{r} \]
\[ = - \frac{\pi^2}{12}. \]
From identity (3.108) and the known result
\[ 2 \sum_{r=1}^\infty (-1)^{r-1} \frac{H_r}{r} = \frac{\pi^2}{6} - \log^2 2, \] ([12], equation 4.2c)
we obtain
\[ 2 \sum_{r=1}^\infty (-1)^{r-1} \frac{H_r^2}{r} = \frac{\pi^2}{12} - \log^2 2. \]
Setting $m = 0$ in identity (3.105) and using identities (3.96) and (3.98) we obtain
\[ 2 \sum_{r=1}^\infty (-1)^{r-1} r H_{r,2} = - \frac{\pi^2}{24} + \log 2 \]
and
\[ 2 \sum_{r=1}^\infty (-1)^{r-1} r H_{r,3} = \frac{\pi^3}{32}. \]
From identities (3.65) and (3.66) we have
\[ 2 \sum_{r=1}^\infty (-1)^{r-1} h_{r,n} h_{r-1,n} = \frac{1}{4^{2n} \Gamma(2n)} \left( \psi_{2n-1} \left( \frac{3}{4} \right) - \psi_{2n-1} \left( \frac{1}{4} \right) \right) = - \beta(2n). \]
In particular
\[ 2 \sum_{r=1}^\infty (-1)^{r-1} h_r h_{r-1} = - G. \]
From the corrected version of equation 4.5c of [12]
\[ 2 \sum_{r=1}^\infty (-1)^{r-1} \frac{h_r}{2r-1} = \frac{\pi \log 2}{4} + G \]
and the identity (3.110) we deduce that

$$2 \sum_{r=1}^{\infty} (-1)^{r-1} h_r^2 = \frac{\pi \log 2}{4}. \quad (3.111)$$

4 Conclusion

We have given and proved a summation identity which we subsequently applied in its various forms to obtain mostly new finite and infinite summation formulas involving the generalized harmonic numbers.
