#### Abstract

In view of the effective range of biological activities exhibited by quinazolines, a novel series of 2,3-disubstitutedquinazolin-4-(3H)-ones were designed, synthesized and evaluated for in vitro anticancer activity against human breast carcinoma cell line (MCF-7). The results of this study showed that 3-(4-aminophenyl)-2-(chloromethyl)quinazolin-4(3H)-one 2, 2-\{[4-(2-chloromethyl-4-oxo-4H-quinazolin-3-yl)-phenyl]diazoenyl\} malononitrile 11a, 2-(2,4-dichlorophenyl)-4-oxoquinazoline-3(4H)-carboxamide 16a and $N$-(2-(2,4-dichlorophenyl)-4-oxoquinazolin$3(4 H)$-yl) benzamide 18 possessed an inhibitory activity against human breast carcinoma with $\mathrm{IC}_{50}(2.84,6.21,4.19$, and $2.48 \mathrm{ug} / \mathrm{well}$ ) respectively. Compounds 2, 16a, and $\mathbf{1 8}$ were more potent compared with the positive control Imatinib with $\mathrm{IC}_{50}, 6.06 \mathrm{ug} /$ well. Molecular docking methodology was performed for compounds 2, 11a, 16a, and 18 into ATP binding site of the epidermal growth factor receptor-tyrosine kinase (EGFR-TK), using gefitinib as a lead compound which proved that the docking results were in coincidence with the biological activity.

Keywords: Imatinib, gefitinib, in vitro antitumor evaluation, MCF-7, molecular docking, EGFRTK, quinazolinones

## 1 Introduction

Cancer represents one of the most severe health problems [1]. It remains one of the most difficult diseases to treat, and is responsible for about $13 \%$ of all deaths worldwide [2]. As chemotherapeutic drugs have a wide range of nonspecific effects, there is an urgent need to develop safe and cost effective anticancer agents [3]. Growth factors and their transmembrane receptor kinase e.g. EGFR (epidermal growth factor receptor) play important roles in cell proliferation, survival, adhesion, migration and differentiation [4]. Breast cancer is the most common tumor among women worldwide. Its incidence is increasing around the world, and it is believed to be the leading cause of cancer mortality among women, according to American Cancer Society [5]. Quinazolines are classes of fused heterocycles that are of considerable interes and play a major role in the field of medicinal chemistry. They are of particular interest due to their diverse pharmacological activities and are considered as promising scaffolds in the search for new bioactive agents [6-19]. Some quinazoline derivatives are potent inhibitors of epidermal growth factor receptor (EGFR). The EGFR is a cellular trans-membrane tyrosine kinases that are over-
expressed in a significant number of human tumors (e.g., breast, ovarian, colon, renal, and prostate) [20].

Figure1. EGFR Tyrosine Kinase inhibitors [20]
A number of anilinoquinazoline containing compounds were evaluated as EGFR kinase inhibitors in cancer clinical trials such as gefitinib (Iressa), erlotinib (Tarceva),

[^0]lapatinib and caneratinib (C11033) (Figure 1). They were recently approved for the treatment of breast cancer and non-small-cell lung cancer [20-23]

Herein, we have designed a number of new quinazoline derivatives, the substitution pattern at the 2,3-disubstituted quinazolinones pharmacophore was selected so as to confer different electronic environment that would affect the lipophilicity, and hence the activity of the target molecules. Moreover, QSAR study was performed to identify the structural features required for the antitumor properties of these new series.

## 2 Materials and methods

### 2.1 Chemistry

Melting points were measured in open capillary tubes using Griffin apparatus and were uncorrected. Elemental microanalyses were carried out at the Regional Centre for Mycology and Biotechnology, Al-Azhar University. The infrared (IR) spectra were recorded using potassium bromide disc technique on a Schimadzu 435 IR spectrophotometer at Micro analytical Center, Ain Shams University and Al-Azhar University.The proton nuclear magnetic resonance ( ${ }^{1} \mathrm{HNMR}$ ) spectra were performed on a Varian Mercury VX-300 NMR spectrophotometer 300 MHz at The Main Chemical Warfare Laboratories, Chemical Warfare Department, Ministry of Defence. DMSO-d6 was used as a solvent, and the chemical shifts were measured in ppm, relative to TMS as an internal standard. As for the proton magnetic resonance, $\mathrm{D}_{2} \mathrm{O}$ was carried out for $\mathrm{NH}, \mathrm{NH}_{2}$ and OH exchangeable protons. Mass spectra were recorded on a DI-50 unit of Shimadzu GC/ MS-QP 2010 plus Spectrometer(Japan) or on single quadrpole mass Spectrometer ISQ LT (Thermo scientific) at the Regional Centre for Mycology and Biotechnology, Al-Azhar University.

Compounds 2-(chloromethyl)-4H-benzo[d][1,3] oxazin-4one 1 and 2-(2,4-dichlorophenyl)-4H-benzo[ $d][1,3]$ oxazin-4-one 13 were prepared according to reported procedures (24,25).

## 3-(4-aminophenyl)-2-(chloromethyl)quinazolin-4(3H)one. (2)

A mixture of 2-(chloromethyl)-4 H -benzo[d][1,3] oxazin-4one $1(2 \mathrm{mmol}, 0.5 \mathrm{gm})$ and 1,4-phenylene diamine (2 mmol, 0.22 gm ) in pyridine ( 10 ml ) was refluxed for 4 h . The precipitated solid obtained on hot was filtered off, washed with ethanol, dried and crystallized from ethanol.

Yield: (43.8 \%); m.p. 200-202 ${ }^{\circ} \mathrm{C}$. Analysis \% for $\mathrm{C}_{15} \mathrm{H}_{12} \mathrm{ClN}_{3} \mathrm{O}$, Calcd. (Found) C: 63.05 (63.27), H: 4.23 (4.31), N: 14.71 (14.93). IR (KBr) $\left(\mathrm{cm}^{-1}\right): 3410-3325$ $\left(\mathrm{NH}_{2}\right), 3136-3020$ (aromatic CH str.), $1697(\mathrm{C}=\mathrm{O}) .{ }^{1} \mathrm{H}-$ NMR (DMSO- $\left.d_{6}-\mathrm{D}_{2} \mathrm{O}\right) \delta(\mathrm{ppm}): 5.82\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Cl}\right), 7.01-$ $7.16\left(\mathrm{~m}, 2 \mathrm{H}\right.$, p-amino phenyl- $\mathrm{H}_{3,5}$ ), 7.53-7.58 (t, 1H, quinazolinone- $\mathrm{H}_{6}$ ), $7.92\left(\mathrm{~d}, 1 \mathrm{H}\right.$, quinazolinone- $\mathrm{H}_{8}$ ), 8.21-
8.24 (m, 2H, p-amino phenyl- $\mathrm{H}_{2,6}$ ), 8.68-8.73 (t,1H, quinazolinone- $\mathrm{H}_{7}$ ), $9.09\left(\mathrm{~d}, 1 \mathrm{H}\right.$, quinazolinone- $\left.\mathrm{H}_{5}\right), 10.53$ (s, $2 \mathrm{H}, \mathrm{NH}_{2}$; exchangeable with $\left.\mathrm{D}_{2} \mathrm{O}\right) . \mathrm{MS}(\mathrm{m} / \mathrm{z}): 285\left(\mathrm{M}^{+}\right.$, $14.73 \%), 287\left(\mathrm{M}^{+}+2,4.31 \%\right), 52.06(100 \%)$.

General procedure for the synthesis of 2 (chloromethyl)-3-(substituted-phenyl) quinazolin-4(3H)-one. (3-9)

Equimolar amounts of compound 1 ( $2 \mathrm{mmol}, 0.5 \mathrm{gm}$ ), and appropriate primary aromatic amine, ( 2 mmol ), were dissolved in pyridine $(10 \mathrm{ml})$ then the mixture was refluxed. The precipitated solid obtained after cooling and pouring on ice water, containing a few drops of HCl , was filtered off, washed with ethanol, dried and crystallized from ethanol.

## 3-(4-(2-hydroxybenzylideneamino)phenyl)-2-

 (chloromethyl)quinazolin-4(3H) one. (10)A mixture of 3-(4-aminophenyl)-2-(chloromethyl) quinazolin-4(3H)-one (2), and 2-hydroxy- benzaldehyde, (2 mmol ), and glacial acetic acid, was refluxed for 8 h . The precipitated solid formed after cooling was filtered off, washed and crystallized from ethanol.
Yield: (30\%); m.p. $211-213^{\circ} \mathrm{C}$. Analysis \% for $\mathrm{C}_{22} \mathrm{H}_{16} \mathrm{ClN}_{3} \mathrm{O}_{2}$, Calcd. (Found) C: 67.78 (68.03), H: 4.14 (4.19), N: 10.78 (10.85). IR(KBr) $\left(\mathrm{cm}^{-1}\right): 3448-3421(\mathrm{OH})$,
$1650(\mathrm{C}=\mathrm{O}), 1608(\mathrm{C}=\mathrm{N}) .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{DMSO}-d_{6}-\mathrm{D}_{2} \mathrm{O}\right) \delta$ (ppm): 4.01 (s, 2H, CH2Cl), 7.12-7.16 (t, 1H, 2-hydroxy-ph- $\left.\mathrm{H}_{5}\right)^{\prime}$, 7.27 (d, 1H, 2- hydroxy-ph- $\mathrm{H}_{6}$ ), 7.44 ( $\mathrm{s}, 1 \mathrm{H}$, $\mathrm{N}=\mathrm{CH}), 7.49-7.53(\mathrm{t}, 1 \mathrm{H}, 2-$ hydroxyl- ph-H4), $8.01(\mathrm{~d}, 1 \mathrm{H}$, $\mathrm{H}_{8}$ ), 8.14-8.17(t, 1H, H6), 8.55-8.59 (t, 1H, H7), $9.02(\mathrm{~d}, 1 \mathrm{H}$, $\left.\mathrm{H}_{5}\right), 9.83\left(\mathrm{~s}, 1 \mathrm{H}, \mathrm{OH}\right.$; exchangeable with $\left.\mathrm{D}_{2} \mathrm{O}\right) . \mathrm{MS}(\mathrm{m} / \mathrm{z})$ : $389\left(\mathrm{M}^{+}, 10.24 \%\right), 391\left(\mathrm{M}^{+}+2,1.50\right), 45.05$ (100 \%).
General procedure for the synthesis of 2-\{[4-(2-chlormethyl-4-oxo-4H-quinazolin-3-yl)-phenyl] diazoen -yl\} derivatives. (11a-c \& 12)

Diazotisation of compound 2 ( $2 \mathrm{mmol}, 0.57 \mathrm{gm}$ ) was performed using a mixture of sodium nitrite $(1.1 \mathrm{mmol}$, 0.15 gm ), and HCl at $0-5^{\circ} \mathrm{C}$ over a period of 30 min . The diazonium salt thus obtained, was treated in ethanol ( 15 ml ) in the presence of sodium hydroxide ( $6 \mathrm{mmol}, 0.25 \mathrm{gm}$ ) with calculated amounts ( 3 mmol ), of some active methylene compounds, namely, malononitrile, ethyl acetoacetate, acetylacetone and $\alpha$-naphthol. After complete addition, the reaction mixture was stirred for further 2 h . The resulting solid was collected by filtration, and crystallized from ethanol to afford the corresponding hydrazono derivatives.

2-\{[4-(2-chloromethyl-4-oxo-4H-quinazolin-3-yl)phenyl]diazoenyl\} malononitrile. (11a)
Yield: (30.8\%); m.p. 390-392 ${ }^{\circ} \mathrm{C}$. Analysis \% for $\mathrm{C}_{18} \mathrm{H}_{11} \mathrm{ClN}_{6} \mathrm{O}$, Calcd. ### 2.2. Antitumor screening

The in vitro anti-tumor activity against human breast cancer
cells (MCF7) of the 26 tested compounds was achieved in the cell culture lab, the Regional Centre for Mycology and Biotechnology, Al-Azhar University, Cairo, Egypt. Imatinib was used as a reference standard and showed $\mathrm{IC}_{50}$ $6.06 \mu \mathrm{~g} / \mathrm{well}$.
The anticancer MCF7 profile suggested that, the tested compounds showed variable activity compared to the reference drug as shown in Table1, on the basis of the following method:

Mammalian cell lines: MCF-7 cells (human breast cancer cell line was obtained from VACSERA Tissue Culture Unit.
Chemicals Used: Dimethyl sulfoxide (DMSO), crystal violet and trypan blue dye were purchased from Sigma (St. Louis, Mo., USA). Fetal Bovine serum, DMEM, RPMI1640, HEPES buffer solution, L-glutamine, gentamycin and $0.25 \%$ Trypsin-EDTA were purchased from Lonza.Crystal violet stain ( $1 \%$ ): It composed of $0.5 \% ~(\mathrm{w} / \mathrm{v}$ ) crystal violet and $50 \%$ methanol then made up to volume with $\mathrm{ddH}_{2} \mathrm{O}$ and filtered through a Whatmann No. 1 filter paper.
Cell line Propagation: The cells were propagated in Dulbecco's modified Eagle's medium (DMEM) supplemented with $10 \%$ heat-inactivated fetal bovine serum, $1 \%$ L-glutamine, HEPES buffer and $50 \mu \mathrm{~g} / \mathrm{ml}$ gentamycin. All cells were maintained at $37^{\circ} \mathrm{C}$ in a humidified atmosphere with $5 \% \mathrm{CO}_{2}$ and were subcultured two times a week.

Cytotoxicity evaluation using viability assay: For cytotoxicity assay, the cells were seeded in 96 -well plate at a cell concentration of $1 \times 10^{4}$ cells per well in $100 \mu \mathrm{l}$ of growth medium. Fresh medium containing different concentrations of the test sample was added after 24 h of seeding. Serial two-fold dilutions of the tested chemical compound were added to confluent cell mono layers dispensed into 96-well, flat-bottomed microtiter plates (Falcon, NJ, USA) using a multichannel pipette. The microtiter plates were incubated at $37^{\circ} \mathrm{C}$ in a humidified incubator with $5 \% \mathrm{CO}_{2}$ for a period of 48 h . Three wells were used for each concentration of the test sample. Control cells were incubated without test sample and with or without DMSO. The little percentage of DMSO present in the wells (maximal $0.1 \%$ ) was found not to affect the experiment. After incubation of the cells for at $37^{\circ} \mathrm{C}$, various concentrations of sample were added, and the incubation was continued for 24 h and viable cells yield was determined by a colorimetric method. In brief, after the end of the incubation period, media were aspirated and the crystal violet solution ( $1 \%$ ) was added to each well for at least 30 minutes. The stain was removed and the plates were rinsed using tap water until all excess stain is removed. Glacial acetic acid (30\%) was then added to all wells and mixed thoroughly, and then the absorbance of the plates were measured after gently shaken on Microplate reader (TECAN, Inc.), using a test wavelength of 490 nm . All results were corrected for background absorbance
detected in wells without added stain. Treated samples were compared with the cell control in the absence of the tested compounds. All experiments were carried out in triplicate. The cell cytotoxic effect of each tested compound was calculated. The optical density was measured with the microplate reader (SunRise, TECAN, Inc, USA) to determine the number of viable cells and the percentage of viability was calculated as [1-(ODt/ODc)] $\mathrm{x} 100 \%$ where ODt is the mean optical density of wells treated with the tested sample and ODc is the mean optical density of untreated cells. The relation between surviving cells and drug concentration is plotted to get the survival curve of each tumor cell line after treatment with the specified compound. The $50 \%$ inhibitory concentration ( $\mathrm{IC}_{50}$ ), the concentration required to cause toxic effects in $50 \%$ of intact cells, was estimated from graphic plots of the dose response curve for each conc. using Graphpad Prism software [26].

### 2.3 Docking methodology

Docking studies have been performed using MOE 2008.10. Docking procedure was followed using the standard protocol implemented in MOE 2008.10 and the geometry of resulting complexes was studied using the MOE's Pose Viewer utility

## 3 Results and Discussion

### 3.1 Chemistry

Quinazoline is one of the most important heterocyclic compounds, possessing varied biological activities, which make it of great scientific interest. Our target in the present work is to design and synthesize new series of quinazoline-$4-(3 \mathrm{H})$-ones as possible anticancer agents.
The known starting materials 2-(chloromethyl)-4 H benzo $[d][1,3]$ oxazin-4-one $\mathbf{1}$, and 2-(2,4-dichlorophenyl)$4 H$-benzo $[d][1,3]$ oxazin-4-one 13, were prepared by reaction of anthranilic acid with chloroacetyl chloride / 2,4dichlorobenzoyl chloride respectively, in pyridine ${ }^{(24-25)}$.
A series of 2,3-disubstituted $4(3 H)$-quinazolinones were prepared through cyclo-condensation reaction, this was performed by intrarmolecular cyclization reaction, via ring opening followed by ring closure of compound $\mathbf{1}$, with different aromatic amines ${ }^{(27)}$ affording compounds 2-9.

The spectral and analytical data of compounds 2-9 were in accordance with the proposed structures. The main characteristic feature for the formation of $4(3 \mathrm{H})$ quinazolinone ring, was the disappearance of the etherial C O band at $1178 \mathrm{~cm}^{-1}$, and the shift of the carbonyl $\mathrm{C}=\mathrm{O}$ band from 1710 to $1697 \mathrm{~cm}^{-1}$.

A representative of this group is compound 2, its IR spectrum displayed a sharp band at $1697 \mathrm{~cm}^{-1}$ corresponding to the carbonyl $\mathrm{C}=\mathrm{O}$ group, in addition to
another band ranging from $3410-3325 \mathrm{~cm}^{-1}$, corresponding to the $\mathrm{NH}_{2}$ stretching, thus confirming the structure of this compound.

Further confirmation was obtained by its ${ }^{\mathbf{1}} \mathbf{H N M R}$ spectrum, which exhibited the $\mathrm{D}_{2} \mathrm{O}$ exchangeable singlet at $\delta 10.53$, attributed to the $\mathrm{NH}_{2}$ group, in addition to the usual singlet signal of $\mathrm{CH}_{2} \mathrm{Cl}$ protons, which appeared at $\delta$ 5.65 ppm .

Scheme 1

Reagents and conditions: (i) Dry acetone stirring at $0-5{ }^{\circ} \mathrm{C}$ for 3 h . (ii) 1,4 Phenelene diamine / pyridine, reflux 4 h . (iii) Aromatic amine / pyridine, reflux and cooling.

The IR spectra of compounds $\mathbf{8}$ and $\mathbf{9}$ were in agreement with the predicted structures as they shared the presence of an amino group, which displayed a characteristic absorption band in the range of $3425-3163 \mathrm{~cm}^{-1}$.

The structure of compound $\mathbf{3}$ was proved through its IR spectrum which showed a broad absorption band corresponding to the OH group at $3525-3367 \mathrm{~cm}^{-1}$.

Examining the ${ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}$ spectrum for compound 4, revealed the existence of the triplet quartet pattern of $\mathrm{CH}_{2} \mathrm{CH}_{3}$ group at $\delta 1.18$ and 3.99 ppm respectively, while the ${ }^{\mathbf{1}} \mathbf{H}$-NMR spectrum of compound $\mathbf{5}$ exhibited an increase in the number of aromatic protons by 7 H belonging to the naphthyl group.

The configuration of compound 6 was based on its ${ }^{1} \mathbf{H}$ NMR spectrum, which displayed the presence of a singlet at $\delta 3.50 \mathrm{ppm}$ representing the aliphatic $\mathrm{CH}_{2}$ protons of the hetero aromatic ring, while for compound 7 an appearance of a characteristic singlet at $\delta 2.61 \mathrm{ppm}$, attributed to the 6 protons of two methyl groups, established its structure. established its structure.

Reagents and conditions : (i) 2-hydroxybenzaldhyde / glacial acetic acid, reflux 8 h . (ii) $\mathrm{NaNO} 2 / \mathrm{HCl} / 0^{0} \mathrm{C}$, stirring for 30 min . (iii) Active methylene compounds
(malononitrile, acetylacetone and ethyl acetoacetate) / $\mathrm{NaOH} / \mathrm{EtOH}$, stirring for 2 h . / cooling. (iv) Alpha-naphthol / $\mathrm{NaOH} / \mathrm{EtOH}$, stirring for 2 h . /cooling.

Schiff's bases were obtained by the reaction of aldehydes / ketones with amines in acidic medium [28]. In the present work the newly synthesized compound $\mathbf{1 0}$ was successfully prepared by refluxing compound $\mathbf{1}$ with 2 -hydroxy benzaldehyde, in glacial acetic acid.

The common feature for this compound, was the disappearance of the $\mathrm{NH}_{2}$ band in its IR spectra, in addition to the presence of a singlet attributed to the imine proton $(\mathbf{C H}=\mathrm{N})$ at $\delta 7.49 \mathrm{ppm}$ in its ${ }^{\mathbf{1}} \mathbf{H}-\mathrm{NMR}$ spectra, denoting the formation of the Schiff's bases.

The IR of compound $\mathbf{1 0}$ was characterized by the existence of the OH absorption bands at $3448-3421 \mathrm{~cm}^{-1}$, in addition to the common features of this group.

The presence of an aromatic amino group in compound 2 encouraged the diazotization reaction. This was achieved by using a mixture of sodium nitrite and HCl at $0-5{ }^{\circ} \mathrm{C}$ [29,30]. The diazonium salt thus obtained, was coupled with active methylene compounds, namely malononitrile, acetylacetone, ethyl acetoacetate and $\alpha$-naphthol, in ethanol in the presence of sodium hydroxide affording compounds 11a-c and 12.

The above mentioned structures were confirmed based on their elemental and spectral data. Their structures were established by IR spectra, which displayed the disappearance of the characteristic $\mathrm{NH}_{2}$ band..

Compound 11a, as one of the formed hydrazono compounds, exhibited a characteristic absorption bands at $2222 \mathrm{~cm}^{-1}$ corresponding to the cyano group, along with the
disappearance of $\mathrm{NH}_{2}$ bands in its IR spectrum. Furthermore, its ${ }^{1} \mathbf{H}-N M R$ spectrum showed the $\mathrm{D}_{2} \mathrm{O}$ exchangeable singlet at $\delta 5.78$, attributed to the NH group.

On the other hand, the structure of compound $\mathbf{1 1 b}, \mathbf{c}$ was confirmed through the spectral data mainly the ${ }^{1} \mathbf{H}-\mathbf{N M R}$.

The ${ }^{1} \mathbf{H}$-NMR spectrum of compound $\mathbf{1 1 b}$ displayed a singlet at $\delta 2.70$ and 2.86 ppm representing the two methyl groups, while the classical signals of triplet-quartet pattern at $\delta 1.26$ and 4.25 ppm were exhibited for compound 11 c , establishing its proposed structure.

| :--- | :--- | :--- |
| a | H | P-CH |

Scheme 3

Reagents and conditions: (i) dry acetone/pyridine, stirring at $0-5{ }^{0} \mathrm{C}$ for 3 h ., then stirring for 1 h at room temp. (ii) $\mathrm{NH}_{2}-\mathrm{NH}_{2} \cdot \mathrm{H}_{2} \mathrm{O} / \mathrm{EtOH}$, reflux 4h. (iii) Phenyl hydrazine/ pyridine, reflux 10h./ cooling. .(iv) $\mathrm{NH}_{2} \mathrm{CONH}_{2}$ or $\mathrm{NH}_{2} \mathrm{CSNH}_{2} /$ pyridine, reflux $8-10 \mathrm{~h} . /$ cooling.(v) paminobenzoic acid/ pyridine, reflux $3 \mathrm{~h} . /$ cooling. (vi) benzoyl chloride/ pyridine, stirring for 2 h ., reflux 15h./cooling. (vii) aromatic aldehydes or ketones/ glacial acetic acid, reflux 10-18h./cooling.

Scheme 3 describes the preparation of compounds 14,15 , 16a,b, 17, 18 and 19a-g respectively.

Condensation of compound 13 with hydrazine hydrate in boiling ethanol resulted in the 3 -amino- $4(3 \mathrm{H})$ quinazolinone derivative, $\mathbf{1 4}$, which was used as a precursor for construction of biologically active heterocycles. ${ }^{(31)}$

In a similar manner, refluxing compound $\mathbf{1 3}$ with phenyl hydrazine in pyridine afforded compound 15.
These compounds were confirmed on the basis of their spectral data, the most characteristic feature was the absorption bands at 3324-3258 and $3282 \mathrm{~cm}^{-1}$ belonging to $\mathrm{NH}_{2}$ and NH groups respectively in their IR spectra.

Compound 13 was converted to 4 -oxoquinazoline- $3(4 H)$ carbamide derivatives, 16a, b by its nucleophilic substitution reaction with urea [32] and thiourea.

Studying the IR spectra of compounds $\mathbf{1 6 a}, \mathbf{b}$ revealed that the two compounds shared the presence of $\mathrm{NH}_{2}$ group absorption band at $3383-3302 \mathrm{~cm}^{-1}$. Further conformation for compound 16a was the appearance of a characteristic absorption bands at $1662,1612 \mathrm{~cm}^{-1}$, corresponding to the two $\mathrm{C}=\mathrm{O}$ groups.

Compound 17 was prepared successfully according to the literature procedure via the cyclo-condensation reaction of compound 13 with an equimolar amount of p-amino benzoic acid in pyridine [27]. Its IR spectrum displayed an absorption band at $1693 \mathrm{~cm}^{-1}$ assigned to the $\mathrm{C}=\mathrm{O}$ group, in addition to another broad band of the OH group at 3290$3236 \mathrm{~cm}^{-1}$.

Its ${ }^{1} \mathbf{H}-N M R$ spectrum exhibited two doublets representing the para-substituted system of the incorporated amine with $J$ constant $=9 \mathrm{~Hz}$, and the $\mathrm{D}_{2} \mathrm{O}$ exchangeable singlet at $\delta$ 12.71 ppm .

Benzoylation reaction was achieved by refluxing compound $\mathbf{1 4}$ with benzoyl chloride in pyridine to afford compound $\mathbf{1 8}$ [33].

The proposed structure of compound $\mathbf{1 8}$ was in agreement with the spectral data, as it showed in its IR spectrum the appearance of a sharp band at $3313 \mathrm{~cm}^{-1}$ attributed to NH group with disappearance of $\mathrm{NH}_{2}$ absorption band, in addition to two absorption bands at $1685,1672 \mathrm{~cm}^{-1}$ corresponding to the two $\mathrm{C}=\mathrm{O}$ groups.

Its ${ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}$ spectrum revealed an increase in the number of aromatic protons by 5 belonging to the phenyl ring.
Condensation of the amino group of compound 14 with aldhehydes / ketones gave a series of Schiff's bases 19a-g [28].

The IR spectra for all derivatives showed the disappearance of $\mathrm{NH}_{2}$ band and the appearance of the characteristic band belonging to $\mathrm{C}=\mathrm{N}$ at $1600 \mathrm{~cm}^{-1}$, and this was taken as an evidence for the formation of the imines compounds.

In addition, the ${ }^{\mathbf{1}} \mathbf{H}-\mathbf{N M R}$ spectra for the derivatives $\mathbf{1 9 a - d}$ exhibited a singlet corresponding to the imine proton $(\mathrm{CH}=\mathrm{N})$ at the range $\delta 8.81$ to 9.14 , while for the derivatives $\mathbf{1 9 e - g}$, the presence of a singlet at $\delta 1.80 \mathrm{ppm}$. attributed to $\left(\mathrm{N}=\mathrm{C}-\mathrm{CH}_{3}\right)$ denoted the formation of the Schiff's bases.

Examining the ${ }^{\mathbf{1}} \mathbf{H} \mathbf{- N M R}$ spectrum of compound $\mathbf{1 9 a}$ as a representing para-substituted system at $\delta 7.28$ and 7.52 representative of this series, showed a common feature, which is the appearance of a singlet at $\delta 2.40 \mathrm{ppm}$ ppm, with $J$ constant $=8.1 \mathrm{~Hz}$. Furthermore, the existence of a signal corresponding to the imine proton $(\mathrm{CH}=\mathrm{N})$ at $\delta$ representing the $\mathrm{CH}_{3}$ protons, in addition to two doublets

### 3.2. Antitumor activity

The newly synthesized compounds were screened against breast cell cancer (MCF-7) using the mentioned technique (viability assay) [26], where the anticancer profile of MCF7 suggested that, the tested compounds showed variable activity compared to the reference drug.
The close examination of the results representing the percentage of growth inhibition and $\mathrm{IC}_{50}$ in Table 1, 2 are resumed in Figure 2, 3 respectively.

From the above-mentioned results we can deduce that the most active compounds were 2, 16a, 11a and 18 exhibiting $\mathrm{IC}_{50}$ (2.84, 4.19, 6.21 and $2.48 \mathrm{ug} / \mathrm{well}$ respectively), compared with the reference Imatinib possessing $\mathrm{IC}_{50} 6.06$ ug/well.

The presence of the p-amino phenyl group in compound 2, the amide group in $\mathbf{1 6 a}$ and the $\mathbf{N H}$ group in $\mathbf{1 8}$ respectively attached to the Nitrogen in the position $\mathbf{3}$ of the quinazolinone ring, contributed to the high anti-breast cancer activity in comparison with the reference Imatinib. This emphasizes the importance of the amino group, either primary or secondary amine, for the activity.

Compound 11a was nearly equipotent to the reference drug, Imatinib, against MCF-7 cell line. This illustrated the significant role of the azide group, additionally, the presence of the azide group increased the binding with the amino acids residues of the receptor as shown in the docking study.

Moderate anti-breast cancer activity was demonstrated by compounds $\mathbf{3}, \mathbf{4}, \mathbf{6}, \mathbf{7}, \mathbf{8}, \mathbf{1 4}, \mathbf{1 5}, 17$ and 19e-g. Compounds 9, 12 and 19d possessed no significant anti-breast cancer activity.
Examining the SARs of compounds 2 and 9 revealed that, replacement of the p- amino group in 2 by electron withdrawing group ( $\mathrm{p}-\mathrm{Cl}$ ), abolished the activity.

In the two analogues 16a,b introducing the $S$ instead of $O$ resulted in abolishing the activity of the later.

Comparing the tested compounds, 14 and $\mathbf{1 5}$, revealed that, replacement of the amino group attached to the Nitrogen at position 3 of quinazolinone ring by the NH-ph, increased the activity by 1.3 folds.

On the contrary the abolished anti-breast carcinoma activity was observed in compound 11a ( $\mathrm{IC}_{50}=45.2 \mu \mathrm{~g} /$ well $)$.

Furthermore, compound $\mathbf{1 2}$ exhibited no anticancer activity against the breast cell line MCF-7, this could be attributed the bulkiness of the naphthyl group in contrast to its
moiety, and exhibited a potent anti-breast cancer activity ( $\left.\mathrm{IC}_{50}=6.21 \mathrm{ug} / \mathrm{well}\right)$.

Referring to the anti-breast cancer activity results of the Schiff's bases, we can conclude that, the Schiff's bases 19ac resulting from reaction of amine with aldehydes are less potent $\left(\mathrm{IC}_{50}=36.4,30.1\right.$ and $40.4 \mu \mathrm{~g} /$ well, respectively $)$, than their counterparts $19 \mathrm{e}-\mathrm{g}$, resulting from reaction of amine with ketones and possessing moderate anticancer activity ( $\mathrm{IC}_{50}=21.1,13.1$ and $19.1 \mu \mathrm{~g} /$ well respectively).

This activity was completely abolished in compound 19d, and this supposes that the six memberd ring of the phenyl substituent, might be considered as an important element for the activity.

It was obvious that, Schiff's base with $\mathrm{p}-\mathrm{Cl}$ substituent, compounds 19b and 19f, $\left(\mathrm{IC}_{50}=30.1\right.$ and $13.1 \mu \mathrm{~g} /$ well respectively), remarkably enhanced the anticancer activity over their analogues possessing p- $\mathrm{CH}_{3}$ or $\mathrm{p}-\mathrm{OCH}_{3}$ group, This could be attributed to the electron withdrawing effect of the Cl group.

structural basis, the most active compounds; 2, 11a, 16a and 18 were evaluated through molecular modelling and
docking techniques.
The level of antitumor activities of the compounds 2, 11a, $16 a$ and 18 over breast cancer cell, in which EGFR kinase is highly expressed, prompted us to perform the molecular docking into the ATP binding site of EGFR kinases to predict if these compounds had analogous binding mode to the EGFR kinase inhibitor. We assumed that the active target compounds 2, 11a, 16a and 18 might demonstrate antiproliferative activity against breast cancer cell lines through inhibition of EGFR.
In the present study, the target compounds were docked into receptor active site of EGFR. [5,34] All calculations were performed using MOE 2008.10 software.The crystal structure of EGFR with gefitinib (Iressa) (IRE), (PDB code: 2ito) was obtained from protein data bank (PDB) and used as the receptor model in the docking simulation to predict binding modes, affinities and orientation at the active site of the enzyme.
The binding energies of compounds $2,11 a, 16 a, 18$ and gefitinib docked into the active site of EGFR were -4.56, 4.47 , $-6.14,-5.21$ and $-2.37 \mathrm{kcal} / \mathrm{mol}$, respectively (Table 3).

These docking studies of the ligand IRE, as shown in Figure 4, revealed the following binding modes:

- Arene-cation interaction between the phenyl group and Lys745.
- Hydrogen bond interaction between the Aliphatic NH group and O in Asp855.
- Hydrophobic interaction between the ethyl
docking techiques.

Figure 4: The proposed binding mode of compound IRE docked in the active site of EGFR; (2D and 3D ligand-
receptor interactions) (hydrogen bonds are illustrated as arrows; C atoms are colored gray, N blue and O red).
The conserved lysine in the N -lobe was found to be important for the stabilization. [35]

The docked model of compound 2 (Figure 5) showed an arene-cation interaction of the benzyl group of quinazolinone ring with Lys745, present in the catalytic core, in addition to a hydrogen bond interaction between the amino phenyl group, and the oxygen of Met793, present in the backbone residues of the connecting hinge. [34] Moreover, the methylene chloride formed a hydrophobic interaction with Leu844, Val 726 and Thr 790.

Concerning compound 16a (Figure 6), the $\mathrm{NH}_{2}$ of the amide group formed a hydrogen bond with Asp 855. A second hydrogen bond was also formed between oxygen of carbonyl group of quinazolinone, and Thr845. Furthermore, an arene-cation interaction of the benzyl group of the quinazolinone with Lys745. Hydrophobic interactions were also demonstrated in its docking model between the amide group and Val726, Leu 844, Leu 718 and Thr790.

Figure 5: The proposed binding mode of compound 2 docked in the active site of EGFR.

On the other hand, the docked model of compound 11a showed three hydrogen bonds between the two cyano groups and three amino acids residues in EGFR (Lys745, Asp855 and Thr845) (Figure 7). In addition, the hydrophobic interactions were observed between
compound 11a and Asp 800, $\operatorname{Arg} 841$ and Ser 719.
The docking study of compound 18 (Figure 8), revealed a hydrogen bond between N1 of the quinazolinone and Lys 745. Another hydrogen bond also formed between oxygen of carbonyl group of the quinazolinone ring, and Ser719.

Figure 6: The proposed binding mode of compound 16a docked in the active site of EGFR

Figure 7: The proposed binding mode of compound 11a docked in the active site of EGFR.

The di-chloro phenyl moiety formed an arene-cation interaction with Lys 745. Hydrophobic interaction was demonstrated between compound 18 and Val 726, Leu 844 and Asp 855.
These results support the postulation of the ability of these compounds to act as EGFR-TKIs

Figure 8: The proposed binding mode of compound 18 docked in the active site of EGFR;

### 3.4. 2D QSAR Study

### 3.4.1 Development of QSAR model

QSAR studies are undoubtedly important in drug design. Once a correlation between structure and activity is established, newly designed compounds, including those not yet synthesized, can be readily screened on the computer to select the structures with desired properties. Then, it is possible to select the most promising compounds to synthesize and test in the laboratory. [36]
2D-QSAR analysis for anti-proliferative activity by the novel synthesized quinazolinones derivatives was performed in order to correlate the biochemical data with synthesized structures, and to identify positive and negative structural features within the designed structures. The QSAR study was performed using Discovery Studio 2.5 software. The training set was composed of 23 synthesized compounds from the present study with their measured $\mathrm{pIC}_{50}\left(-\log \mathrm{IC}_{50}\right)$ against MCF-7 cancer cell line for QSAR modeling. The remaining three compounds $(\mathbf{2}, \mathbf{3}, \mathbf{1 6 b})$ were adopted as an external test subset for validating the QSAR model.
"Calculate Molecular Properties" module was used for calculating different molecular properties of the training set compounds. 2D Descriptors involved: AlogP, molecular properties, molecular property counts, surface area and volume and topological descriptors, while the 3D descriptors involved: Dipole, jurs descriptors, principle moments of inertia, shadow indices and surface area and volume.

Genetic function approximation (GFA) was utilized to search for the best possible QSAR regression equation capable of correlating the variations in the biological activities of the training set compounds with variations in the generated descriptors, i.e., multiple linear regression modeling (MLR).

QSAR model was validated employing leave one-out crossvalidation by setting the folds to a number much larger than the number of samples, $r 2$ (squared correlation coefficient value) and $r 2$ prediction (predictive squared correlation coefficient value), residuals between the predicated and experimental activity of the test set and training set.

### 3.4.2 QSAR study results

Table 4: Experimental activities of the synthesized derivatives against the predicted activities according to the equation.

| Compound | Experimental activity <br> $\left(-\operatorname{logIC}_{50}\right)$ | Predicted <br> Activity <br> $\left(-\operatorname{logIC}_{50}\right)$ | Residual |
| :--- | :--- | :--- | :--- |

| 14 | -1.69758 | -1.69758 | $3.43812 \mathrm{e}-10$ |
| 15 | -1.46045 | -1.46045 | $-7.54952 \mathrm{e}-15$ |
| 16 a | -1.09968 | -1.09968 | $-2.03961 \mathrm{e}-11$ |
| 17 | -1.7638 | -1.7638 | $2.45763 \mathrm{e}-11$ |
| 18 | -0.770115 | -0.770115 | $-6.28578 \mathrm{e}-11$ |
| 19 a | -1.95148 | -1.91668 | -0.0348025 |
| 19 b | -1.84813 | -1.84813 | $-3.25534 \mathrm{e}-09$ |
| 19 c | -1.98005 | -1.960 | 0.0348025 |
| 19 d | -2.11578 | -2.11578 | $--6.76161 \mathrm{e}-11$ |
| 19 e | -1.70001 | -1.70001 | $2.83622 \mathrm{e}-09$ |
| 19 f | -1.4729 | -1.5077 | 0.0348025 |
| 19 g | -1.64068 | -1.60588 | -0.0348025 |

Equation 1 represents the best performing QSAR model
$-\log _{\mathbf{I C}}^{50}=-2.1315-1.771[$ ALogP_AtomClassName] + 0.6367 [ALogP_AtomScore] + 0.7918 [ES _Count_ ssNH]

In this equation, $-\log I C_{50}$ is the negative logarithmic value of the concentration required to produce $50 \%$ inhibition of MCF-7 cancer cells.

According to the equation the QSAR model was represented graphically by scattering plots of the experimental ( $\mathrm{pIC}_{50}$ ) versus the predicted bioactivity (MLRT1) values $-\operatorname{logIC} 50$ for the training set compounds as shown in Figure 9. The method used to build the model was Least-Squares, $r 2=0.999, r 2(\mathrm{adj})=0.773, r^{2}(\mathrm{prd})$ $=0.714$, Least- Squared error $=0.172$. Where $r^{2}(\operatorname{adj})$ is $r^{2}$ adjusted for the number of terms in the model; $r^{2}$ (pred) is the prediction $c$, equivalent to $q^{2}$ from a leave-1-outcross validation.

Figure 9: Predicted versus experimental $\mathrm{pIC}_{50}$ of the tested compounds against MCF-7 cell line. $\mathrm{r} 2=0.999$

In conclusion, the equation (1) suggested that the antiproliferative activity of the synthesized compounds is mainly affected by hydrophobicity of the molecule (ALogP) and the E-state count of nitrogen atom (ES _Count_ ssNH).
ALogP is a measure of the hydrophobicity of the molecule;
it is calculated in Discovery Studio as the Log of the octanol-water partition coefficient using Ghose and Crippen's method. [37].

The estate keys calculate the sums of electrotopological state (E-state) values and/or the counts of each atom type. ES _Count_ ssNH calculates the E-state count for nitrogen. [38].
It was found that the anti-proliferative activity is negatively correlated with the hydrophobicity (ALogP) and positively correlated with the estate keys of the synthesized compounds

### 3.4.3 QSAR Validation

Robustness of the established QSAR model was verified by using; Leave-one-out (LOO) internal validation ( $r 2=$ 0.999 ). Cross-validation was also employed where $q 2$, which is equivalent to $r 2$ (pred), 0.714 in addition, validation was employed by measuring the residuals between the experimental and the predicted activities of the training set. Table 4

Moreover, the experimental and expected activities as well as the residuals of the compounds, used as statistical outliers in building the three models, are presented in (Table 5). Interestingly, the predicted activities by the generated QSAR models were very close to those observed experimentally, indicating that these models could be applied for further prediction of more effective hits having the same skeletal framework.

Table 5: Experimental activities of compounds 2, 3 and 16b, used as statistical outliers against the predicted activities according to the equation.

| Compound | Experimental activity <br> $\left(-\operatorname{logIC}_{50}\right)$ | Predicted <br> Activity <br> $\left(-\operatorname{logIC}_{50}\right)$ | Residual |
| :--- | :--- | :--- | :--- |
| 2 | 00.998259 | 00.998259 | $4.17129 \mathrm{e}-11$ |
| 3 | -1.67394 | -1.67394 | $1.81322 \mathrm{e}-12$ |
| 16 b | -2.11737 | -2.11727 | $-5.41469 \mathrm{e}-11$ |

## 4 Conclusion

In the present work twenty six novel derivatives of 2, 3-disubstitutedquinazolin-4-(3H)-ones were synthesized and evaluated as anti-breast cancer agents, using Imatinib as reference drug. Amongst these novel compounds, four derivatives (2, 11a, 16b and 18) were displayed high anti breast cancer activity against the reference compound.

The later compounds were evaluated through molecular modelling and docking techniques and compared with IRE (gefitinib) in the binding site of EGFR.
The 2D QSAR models generated by Discovery studio 2.5 software, showed some important geometric and molecular
descriptors that might be controlling the activities of these novel compounds. These results suggest that the novel 2,3-disubstitutedquinazolin-4-(3H)-ones derivatives could be further investigated for their inhibitory activity against human breast carcinoma cell line (MCF-7).
